Steady State Compressible Fluid Flow in Porous Media

Peter Ohirhian
University of Benin, Petroleum Engineering Department
Benin City, Nigeria

Introduction

Darcy showed by experimentation in 1856 that the volumetric flow rate through a porous sand pack was proportional to the flow rate through the pack. That is:

\[
\frac{dp}{d \ell} = K' \frac{Q}{K} = K' v
\]  \hspace{1cm} (i)

(Nutting, 1930) suggested that the proportionality constant in the Darcy law \((K')\) should be replaced by another constant that depended only on the fluid property. That constant he called permeability. Thus Darcy law became:

\[
\frac{dp}{d \ell} = k \frac{v}{\mu}
\]  \hspace{1cm} (ii)

Later researches, for example (Vibert, 1939) and (LeRosen, 1942) observed that the Darcy law was restricted to laminar (viscous) flow. (Muskat, 1949) among other later researchers suggested that the pressure in the Darcy law should be replaced with a potential \((\Phi)\). The potential suggested by Muskat is:

\[
\Phi = p \pm \rho gz
\]

Then Darcy law became:

\[
- \frac{dp}{d \ell} = k \frac{v}{\mu} \pm \rho g
\]  \hspace{1cm} (iii)

(Forchheimer, 1901) tried to extend the Darcy law to non laminar flow by introducing a second term. His equation is:
(Brinkman, 1947) tried to extend the Darcy equation to non viscous flow by adding a term borrowed from the Navier Stokes equation. Brinkman equation takes the form:

\[ \frac{dp}{d\ell_p} = \frac{k_v}{\mu} \pm \rho g \cdot \beta \rho v^2 \]  

(iv)

In 2003, Belhaj et al. re-examined the equations for non viscous flow in porous media. The authors observed that; neither the Forchheimer equation nor the Brinkman equation used alone can accurately predict the pressure gradients encountered in non viscous flow, through porous media. According to the authors, relying on the Brinkman equation alone can lead to underestimation of pressure gradients, whereas using Forchheimer equation can lead to overestimation of pressure gradients. Belhaj et al combined all the terms in the Darcy , Forchheimer and Brinkman equations together with a new term they borrowed from the Navier Stokes equation to form a new model. Their equation can be written as:

\[ \frac{dp}{d\ell_p} = \frac{k_v}{\mu} \pm \rho g \cdot \beta \rho v^2 + \frac{\mu v^2}{k} \left( \frac{\rho v d\gamma}{d\ell_p} \right) \]  

(vi)

In this work, a cylindrical homogeneous porous medium is considered similar to a pipe. The effective cross sectional area of the porous medium is taken as the cross sectional area of a pipe multiplied by the porosity of the medium. With this approach the laws of fluid mechanics can easily be applied to a porous medium. Two differential equations for gas flow in porous media were developed. The first equation was developed by combining Euler equation for the steady flow of any fluid with the Darcy equation; shown by (Mohr, 2008) to be an incomplete expression for the lost head during laminar (viscous) flow in porous media and the equation of continuity for a real gas. The Darcy law as presented in the API code 27 was shown to be a special case of this differential equation. The second equation was derived by combining the Euler equation with the a modification of the Darcy-Weisbach equation that is known to be valid for the lost head during laminar and non laminar flow in pipes and the equation of continuity for a real gas. Solutions were provided to the differential equations of this work by the Runge- Kutta algorithm. The accuracy of the first differential equation (derived by the combination of the Darcy law, the equation of continuity for a real gas and the Euler equation) was tested by data from the book of (Amyx et al., 1960). The book computed the permeability of a certain porous core as 72.5 millidracy while the solution to the first equation computed it as 72.56 millidarcy. The only modification made to the Darcy-Weisbach formula (for the lost head in a pipe) so that it could be applied to a porous medium was the replacement of the diameter
of the pipe with the product of the pipe diameter and the porosity of the medium. Thus the solution to the second differential equation could be used for both pipe and porous medium. The solution to the second differential equation was tested by using it to calculate the dimensionless friction factor for a pipe (f) with data taken from the book of (Giles et al., 2009). The book had f = 0.0205, while the solution to the second differential equation obtained it as 0.02046. Further, the dimensionless friction factor for a certain core (f_p) calculated by the solution to the second differential equation plotted very well in a graph of f_p versus the Reynolds number for porous media that was previously generated by (Ohirhian, 2008) through experimentation.

Development of Equations

The steps used in the development of the general differential equation for the steady flow of gas pipes can be used to develop a general differential equation for the flow of gas in porous media. The only difference between the cylindrical homogenous porous medium lies in the lost head term. The equations to be combined are:

(a) Euler equation for the steady flow of any fluid.
(b) The equation for lost head
(c) Equation of continuity for a gas.

The Euler equation is:

\[
\frac{dp}{\gamma} + \frac{v dv}{g} \pm \frac{d\ell_p}{p} \sin \theta + dh = 0
\]  

In equation (1), the positive sign (+) before \( d\ell_p \sin \theta \) corresponds to the upward direction of the positive z coordinate and the negative sign (-) to the downward direction of the positive z coordinate. In other words, the plus sign before \( d\ell_p \sin \theta \) is used for uphill flow and the negative sign is used for downhill flow.

The Darcy-Weisbach equation as modified by (Ohirhian, 2008) (that is applicable to laminar and non laminar flow) for the lost head in isotropic porous medium is:

\[
\frac{d\ell}{L} = \frac{32 \gamma v \mu d \ell_p}{\gamma d_p 2}
\]  

The (Ohirhian, 2008) equation (that is limited to laminar flow) for the lost head in an isotropic porous medium is:

\[
\frac{d\ell}{L} = \frac{32 \gamma v \mu d \ell_p}{\gamma d_p 2}
\]
The Darcy-Weisbach equation as modified by (Ohirhian, 2008) (applicable to laminar and non-laminar flow) for the lost head in isotropic porous medium is:

\[ \frac{dh}{L} = \frac{f}{2g} \frac{v^2}{d} \]  

(4)

The Reynolds number as modified by (Ohirhian, 2008) for an isotropic porous medium is:

\[ R_{NP} = \frac{\gamma v d_p}{g \mu} \frac{4 \gamma Q}{\pi g \mu d_p} = \frac{4W}{\pi g \mu d_p} \]  

(5)

In some cases, the volumetric rate \( Q \) is measured at a base pressure and a base temperature. Let us denote the volumetric rate measured at a base pressure \( P_b \) and a base temperature \( T_b \) then,

\[ W = \frac{\gamma b Q_b}{g d_p} \]

The Reynolds number can be written in terms of \( \gamma_b \) and \( Q_b \) as

\[ R_{NP} = \frac{4 \gamma_b Q_b}{\pi g \mu d_p} \]  

(6)

If the fluid is a gas, the specific weight at \( P_b \) and \( T_b \) is

\[ \gamma = \frac{P_b M}{\pi_b T_b R} \]  

(7)

Also, \( M = 28.97 G \), then:

\[ \gamma = \frac{28.97 G p_b}{\pi_b T_b R} \]  

(8)

Substitution of \( \gamma_b \) in equation (4.8) into equation (4.6) leads to:

\[ R_{NP} = \frac{36.88575 G p_b Q_b}{R g d_p \mu g z_b T_b} \]  

(9)
Example 1
In a routine permeability measurement of a cylindrical core sample, the following data were obtained:
Flow rate of air = 2 cm$^2$ / sec
Pressure upstream of core = 1.45 atm
Pressure downstream of core = 1.00 atm
Flowing temperature = 70 $^\circ$ F
Viscosity of air at flowing temperature = 0.02 cp
Cross sectional area of core = 2 cm$^2$
Length of core = 2 cm
Porosity of core = 0.2

Find the Reynolds number of the core

Solution
Let us use the pounds seconds feet (p s f) consistent set units. Then substitution of values into

$$\gamma_b = \frac{p_b M}{\gamma_b T_b R_p}$$

gives:

$$\gamma_b = \frac{14.7 \times 144 \times 28.97}{1 \times 530 \times 1545} = 0.0748 / b / ft^3$$

$$Q_b = 2 \text{ cm}^3 / \text{sec} = 2 \times 3.531467 \text{ E} - 5 \text{ ft}^3 / \text{sec}$$

$$W = \gamma_b Q_b = 5.289431 \text{ E} - 6 / b / \text{sec}$$

$$\mu = 0.02 \text{ cp} = 0.02 \times 2.088543 / \text{b} / \text{sec} / \text{ft}^2$$

$$A_p = \frac{\pi d_p^2}{4}, \text{ then, } d_p = 1.128379 \sqrt{A_p}$$

$$= 4.177086 \text{ E} - 7 / \text{b} / \text{sec} / \text{ft}^2 \times 1.128379 \sqrt{2 \times 0.2} = 0.713650 \text{ cm}$$

$$= 0. 0 23414 \text{ ft}$$
Then 

\[ R_{NP} = \frac{4 \frac{W}{g \mu d_p}}{\pi} = \frac{4 \times 5.289431 \times 10^{-6}}{\pi \times 32.2 \times 4.177086 \times 7 \times 0.02341} = 21.385242 \]

**Alternatively**

\[ R_{NP} = \frac{36.88575 G_b P_b Q_b}{R g d_p \mu g z_T b_T} = \frac{36.88575 \times 1 \times 14.7 \times 144 \times 7.052934 \times 10^{-5}}{32.2 \times 4.177086 \times 7 \times 1 \times 530 \times 0.023414} = 21.385221 \]

The equation of continuity for gas flow in a pipe is:

\[ W = \gamma A_1 v_1 = \gamma A_2 v_2 = \text{Constant} \quad (10) \]

Then, \( W = \gamma A v \).

In a cylindrical homogeneous porous medium the equation of the weight flow rate can be written as:

\[ W = \gamma A_p v. \quad (11) \]

Equation (11) can be differentiated and solved simultaneously with the lost head formulas (equation 2, 3 and 4), and the energy equation (equation 1) to arrive at the general differential equation for fluid flow in a homogeneous porous media.

Regarding the cross sectional area of the porous medium \( A_p \) as a constant, equation (11) can be differentiated and solve simultaneously with equations (2) and (1) to obtain:

\[ \frac{d}{dp} \left( \frac{c l v \mu}{k} \gamma \sin \theta \right) = 1 - \frac{W^2}{\gamma^2 A_p g d_p} \frac{d \gamma}{d p} \quad (12) \]

Equation (12) is a differential equation that is valid for the laminar flow of any fluid in a homogeneous porous medium. The fluid can be a liquid of constant compressibility or a gas. The negative sign that proceeds the numerator of equation (12) shows that pressure decreases with increasing length of porous media.

The compressibility of a fluid \( C_f \) is defined as:

\[ C_f = \frac{\partial \gamma}{\partial P} \]

www.intechopen.com
\[ C_f = \frac{1}{\gamma} \frac{d / p}{d / p} \]  

(13)

Combination of equations (12) and (13) leads to:

\[ \frac{d / p}{d / p} = \left( \frac{c / v \mu}{k} \gamma \sin\theta \right) \left( 1 - \frac{W^2}{\gamma A p^2 g} \right) \]  

(14)

Differentiation of equation (11) and simultaneous solution with equations (2), (1) and (13) after some simplifications, produces:

\[ \frac{d / p}{d / p} = \left( \frac{2c / v \mu}{d / p^2} \gamma \sin\theta \right) \left( 1 - \frac{W^2 C_f}{\gamma A p^2 g} \right) \]  

(15)

Differentiation of equation (6) and simultaneous solution with equations (4), (1) and (13) after some simplifications produces:

\[ \frac{d / p}{d / p} = \left( \frac{f_p W^2}{2 \gamma A p^2 d / p} \gamma \sin\theta \right) \left( 1 - \frac{W^2 C_f}{\gamma A p^2 g} \right) \]  

(16)

Equation (16) can be simplified further for gas flow through homogeneous porous media. The cross sectional area of a cylindrical cross medium is:

\[ A_p = \frac{\pi d_p^2}{4} \]  

(17)
The equation of state for a non ideal gas is:

\[ \gamma = \frac{p M}{z T R} \]  

(18)

Where

- \( p \) = Absolute pressure
- \( T \) = Absolute temperature

Multiply equation (11) with \( \gamma \) and substitute \( \Lambda \) in equation (17) and use the fact that:

\[ \int p \, dp \] = \[ \int \frac{d \ell}{p} \]

Then

\[ \frac{d p}{d \ell} = \frac{1}{2} \frac{d^2 p}{d \ell^2} \ vacuum \]

(19)

The compressibility of ideal gas \( (C_g) \) is defined as

\[ C_g = \frac{1}{p} - \frac{1}{z} \]  

(20)

For an ideal gas such as air,

\[ C_g = \frac{1}{p} \]  

(21)

(Matter et al, 1975) and (Ohirhian, 2008) have proposed equations for the calculation of the compressibility of hydrocarbon gases. For a sweet natural gas (natural gas that contains CO\textsubscript{2} as major contaminant), (Ohirhian, 2008) has expressed the compressibility of the real gas \( (C_g) \) as:

\[ C_r = \frac{K}{p} \]  

(22)

For Nigerian (sweet) natural gas \( K = 1.0328 \) when \( p \) is in psia. Then equation (19) can then be written compactly as:
Steady State Compressible Fluid Flow in Porous Media

The equation of state for a non ideal gas is:

\[ \frac{d p^2}{d \ell} = \frac{(AAp \pm B_p p^2)}{(1 - \frac{C_p}{p^2})} \]  \hspace{1cm} (23)

Where

\[ AA_p = \frac{1.621139 f W^2 zRT}{p^5 M} \], \hspace{1cm} B_p = \frac{2M \sin \theta}{zRT} \], \hspace{1cm} C_p = \frac{KW^2 zRT}{gMd_p} 4 \]

The denominator of the differential equation (23) is the contribution of kinetic effect to the pressure drop across a given length of a cylindrical isotropic porous medium. In a pipe the kinetic contribution to the pressure drop is very small and can be neglected. What of a homogeneous porous medium?

**Kinetic Effect in Pipe and Porous Media**

An evaluation of the kinetic effect can be made if values are substituted into the variables that occurs in the denominator of the differential equation (23)

**Example 2**

Calculate the kinetic energy correction factor, given that 0.75 pounds per second of air flow isothermally through a 4 inch pipe at a pressure of 49.5 psia and temperature of 90°F.

**Solution**

The kinetic effect correction factor is

\[ C = \frac{1}{2} - \frac{C}{p^2} \]

Where \( C \) for a pipe is given by,

\[ C = \frac{KW^2 zRT}{gMd_p} 4 \]

Here

\[ \omega = 0.75 \hspace{1cm} \text{lb/sec}, \hspace{1cm} d = 4 \text{inch} = 4/12 \text{ ft} = 0.333333 \text{ ft} \]

\[ p = 45.5 \text{ psia} = 49.5 \times 44 \text{ psf} = 7128 \text{ psf}, \hspace{1cm} T = 90 \hspace{1cm} \text{F} = (90 + 460) \hspace{1cm} \text{R} = 550 \hspace{1cm} \text{R} \]

\( K = 1 \) for an ideal gas, \( z = 1.0 \) (air is the fluid), \( R = 1545, \hspace{1cm} g = 32.2 \hspace{1cm} \text{ft/sec}^2, \hspace{1cm} M = 28.97 \).

Then,

\[ C = \frac{1 \times 0.75^2 \times 1 \times 1545 \times 550}{32.2 \times 28.97 \times 0.333333^4} = 41504.58628 \]

www.intechopen.com
The kinetic effect correction factor is

\[ 1 - \frac{C}{p^2} = 1 - \frac{41504.58628}{7128^2} = 0.999183 \]

Example 3
If the pipe in example 1 were to be a cylindrical homogeneous porous medium of 25% porosity, what would be the kinetic energy correction factor?

Solution

Here, \( d_p = d \sqrt{\phi} = 0.33333 \sqrt{0.25} = 0.166667 \) ft

\[ C_p = \frac{1 \times 0.75 \times 1 \times 1545 \times 550}{32.2 \times 28.97 \times 0.166667^4} = 344046.0212 \]

Then,

\[ 1 - \frac{C_p}{p^2} = 1 - \frac{3441046.0212}{7128^2} = 0.993221 \]

The kinetic effect is also small, though not as small as that of a pipe. The higher the pressure, the more negligible the kinetic energy correction factor. For example, at 100 psia, the kinetic energy correction factor in example 2 is:

\[ 1 - \frac{3441046.0212}{(100 \times 144)} = 0.998341 \]

Simplification of the Differential Equations for Porous Media

When the kinetic effect is ignored, the differential equations for porous media can be simplified. Equation (14) derived with the Darcy form of the lost head becomes:

\[ \frac{d p}{d \ell_1} = \left( \frac{c}{v} \frac{\mu}{k} \right) \frac{\gamma \sin \theta}{x} \]

(24)

Equation (15) derived with the (Ohirhian, 2008) form of the lost head becomes:

\[ \frac{d p}{d \ell_2} = \left( \frac{32}{d p^2} \frac{c}{v} \frac{\mu}{k} \right) \frac{\gamma \sin \theta}{x} \]

(25)

Equation (16) derived with the (Ohirhian, 2008) modification of the Darcy-Weisbach lost head becomes:

www.intechopen.com
The kinetic effect correction factor is

\[ \Phi = \frac{W^2}{2 \gamma d_{eq}^2} \times \gamma \sin \theta \] (26)

In terms of velocity (v) equation (26) can be written as:

\[ \frac{dp}{d \ell_p} = \left( \frac{f_p W^2}{2 \gamma A_p^2 \frac{dp}{d \ell_p}} \right) \times \gamma \sin \theta \] (27)

Making velocity (v) or weight (W) subject of the simplified differential equations

When v is made subject of equation (24), we obtain:

\[ v = \frac{-k}{c \mu} \left( \frac{dp}{d \ell_p} \times \gamma \sin \theta \right) \] (28)

When v is made subject of equation (25), we obtain:

\[ v = \frac{-d_p^2}{32c \mu} \left( \frac{dp}{d \ell_p} \times \gamma \sin \theta \right) \] (29)

When \( v^2 \) is made subject of equation (27), we obtain:

\[ v^2 = \frac{-2 g d_p}{f_p \gamma} \left( \frac{dp}{d \ell_p} \times \gamma \sin \theta \right) \] (30)

When \( W^2 \) is made subject of equation (26), we obtain:

\[ W^2 = \frac{-2 g d_p A_p^2}{f_p \gamma} \left( \frac{dp}{d \ell_p} \times \gamma \sin \theta \right) \] (31)

Let S be the direction of flow which is always positive, then equation (28) can be written as:

\[ v_s = \frac{-k}{\mu} \left( \frac{dp}{ds} - \frac{\gamma}{1.01325 \times 10^6} \right) \] (32)

Where:
\( V_s = \) Volumetric flux across a unit area of porous medium in unit time along flow path, \( S \text{ cm} / \text{sec} \)

\( \gamma = \rho g = \) Specific weight of fluid, gm weight / cc

\( \rho = \) Mass Density of fluid, gm mass / cc

\( g = \) Acceleration due to gravity, 980.605 cm / sec \(^2\)

\( \frac{dp}{ds} = \) Pressure gradient along \( S \) at the point to

which \( V_s \) refers, atm / cm

\( \mu = \) Viscosity of the fluid, centipoises

\( z = \) Vertical coordinate, considered positive downwards, cm

\( k = \) Permeability of the medium, darcys.

\( 1.01325 \times 10^6 = \) dynes / sq cm atm

According to (Amyx et al., 1960), this is “the generalized form of Darcy law as presented in APT code 27”.

**Horizontal and Uphill Gas Flow in Porous Media**

In uphill flow, the + sign in the numerator of equation (23) is used. Neglecting the kinetic effect, which is small, equation (23) becomes

\[
\frac{dp^2}{d\ell_p} = AA_p + Bp^2
\]

\[
AA = \frac{1.621139f_p zTR^2}{5g d_p M_p}
\]

\[
B = \frac{2M\sin\theta}{zTR_p}
\]

An equation similar to equation (33) can also be derived if the Darcian lost head is used. The horizontal / uphill gas flow equation in porous media becomes.
\[ \frac{dp^2}{d\varphi_p} = \frac{AA_p}{p} + B_p p^2 \]  

(34)

Where

\[ \frac{AA_p}{p} = \frac{2 c' \mu zTRW}{A_p Mk} = \frac{8 c' \mu zTRW}{\pi d_p^2 Mk} \]

\[ = \frac{2.546479 \ c' \mu zTRW}{d_p^2 Mk} \]

Solution to the Horizontal/Uphill Flow Equation

Differential equations (33) and (34) are of the first order and can be solved by the classical Runge-Kutta algorithm. The Runge-Kutta algorithm used in this work came from book of (Aires, 1962) called “Theory and problems of Differential equations”. The Runge-Kutta solution to the differential equation

\[ \frac{dy}{dx} = f(x, y) \text{ at } x = x_n \text{ given that} \]

\[ y = y_0 \text{ at } x = x_0 \text{ is} \]

\[ y = y_0 + \frac{1}{6} \left( k_1 + 2(k_2 + k_3 + k_4) \right) \]

(35)

where

\[ k_1 = Hf(x_0, y_0) \]

\[ k_2 = Hf(x_0 + \frac{1}{2} H, y_0 + \frac{1}{2} k_1) \]

\[ k_3 = Hf(x_0 + \frac{1}{2} H, y_0 + \frac{1}{2} k_1) \]

\[ k_4 = Hf(x_0 + H, y_0 + k_3) \]

\[ H = \frac{x_n - x_0}{n} \]

\[ n = \text{sub intervals (steps)} \]

Application of the Runge-Kutta algorithm to equation (33) leads to:
\[ p_1^2 = p_2^2 + \bar{y}_a \]  

(36)

Where

\[ \bar{y}_a = a a_p \left( (1 + x_a + 0.5 x_a^2 + 0.36 x_a^3) \right) \]

\[ + \frac{p_2^2}{6} \left( 4.96 x_a + 1.48 x_a^2 + 0.72 x_a^3 \right) \]

\[ + \frac{u_p}{6} \left( 4.96 + 1.96 x_a + 0.72 x_a^2 \right) \]

\[ a a_p = (A A_p^2 + S_2) L \]

\[ A A_p^2 = \frac{1.621139 f_p z_2 T_2 R W^2}{g d_p^5 M} \]

\[ S_2 = \frac{2 M \sin \theta p_2^2}{z_2 T_2 R} \]

\[ u_p = \frac{1.621139 f_p z_{av} T_{av} R W^2}{g d_p^5 M} \]

\[ x_a = \frac{2 M \sin \theta L}{z_{av} T_{av} R} \]

Where:

- \( p_1 \) = Pressure at inlet end of porous medium
- \( p_2 \) = Pressure at exit end of porous medium
- \( f_p \) = Friction factor of porous medium.
- \( \theta \) = Angle of inclination of porous medium with horizontal in degrees.
- \( z_2 \) = Gas deviation factor at exit end of porous medium.
- \( T_2 \) = Temperature at exit end of porous medium
- \( T_1 \) = Temperature at inlet end of porous medium
\[ p_1^2 = p_2^2 + \gamma_b \]  

Application of the Runge-Kutta algorithm to equation (34) produces.

\[ \gamma_a = a p \left( 1 + x_a + 0.5 x_a^2 + 0.25 x_a^3 \right) \]

\[ + \frac{p_2}{6} \left( 5 x_a + 2 x_a^2 + 0.5 x_a^3 \right) \]

\[ + \frac{u p}{6} (5 + 2 x_a + 0.5 x_a^2) \]
Where \( \Delta \rho_p = (A\rho_{p2}^2 + S) \) L

\[
A\rho_{p2} = \frac{2c'\mu z_2 T_2 RW}{A_p M k} = \frac{8c'\mu z_2 T_2 RW}{\pi d_p^2 M k}
\]

\[
S_2 = \frac{2M \sin \theta p_2^2}{z_2 T_2 R}, u_p = \frac{2c'\mu z_{av}T_{av}RW}{A_p M k}
\]

\[
2.546479c'\mu z_{av}T_{av}RW
\]

\[
d_p^2 M k
\]

\[
x_b = \frac{2M \sin \theta L}{b z_{av} T_{av} R}
\]

Where

\( z_{av} = \) Average gas deviations factors evaluated with \( T_{av} \) and \( p_{av} \)

\( T_{av} = \) Arithmetic average Temperature of the porous medium = 0.5(\( T_1 + T_2 \)).

\( p_{av} = \sqrt{p_2^2 + 0.5a_p} \)

All other variables remain as defined in equation (36). In isothermal flow where there is not much variation in the gas deviation factor \( z \) between the mid section and inlet and of the porous medium there is no need to make compensation in the \( k_4 \) parameter in the Runge Kuta algorithm, then equation (37) becomes:

\[
p_1^2 = p_2^2 + \varphi_{bT}
\]
Where:

\[ \gamma_{bT} = \frac{a_p b}{\rho} \left( 1 + x_b + 0.5x_b^2 + 0.25x_b^3 + 0.5x_b^4 \right) \]

\[ + \frac{p_2^2}{6} \left( 5x_b + 2x_b^2 + 0.5x_b^3 \right) \]

\[ + \frac{\mu_p b}{6} \left( 5 + 2x_b + 0.5x_b^2 \right) \]

Equation (36) can be arranged as:

\[
W^2 f_p B_B P^a z_2 T^2 \left[ \left( 1 + x_c + 0.5x_c^2 + 0.25x_c^3 \right) \right] \]

\[
+ \left( 5 + 2x_c + 0.5x_c^2 \right) = \]

Where:

\[ \gamma_{bT} = \frac{a_p b}{\rho} \left( 1 + x_b + 0.5x_b^2 + 0.25x_b^3 + 0.5x_b^4 \right) \]

\[ + \frac{p_2^2}{6} \left( 5x_b + 2x_b^2 + 0.5x_b^3 \right) \]

\[ + \frac{\mu_p b}{6} \left( 5 + 2x_b + 0.5x_b^2 \right) \]

Equation (36) can be arranged as:

\[
W^2 f_p B_B P^a z_2 T^2 \left[ \left( 1 + x_c + 0.5x_c^2 + 0.25x_c^3 \right) \right] \]

\[
+ \left( 5 + 2x_c + 0.5x_c^2 \right) = \]

Where:

\[ PU = z_{av} T_{av} \left( 4.96x_c^2 + 1.48x_c^2 + 0.72x_c^2 \right) \]

\[ BB = \frac{1.621139 RL}{6 g_d M}, \quad S_2 = \frac{2M \sin \theta p_2}{z_2 T_2 R}, \quad x_c = \frac{2M \sin \theta L}{z_{av} c T_{av} R} \]

\[ z_{av} = \text{Average gas deviations factors} \]

\[ \text{evaluated with } T_{av} \text{ and } p_{av} \text{ and} \]

\[ p_{av} = \sqrt{\frac{p_1^2 + p_2^2}{2}} \]

All other variables remain as defined in previous equations.

In isothermal flow where there is no significant change in the gas deviation factor (z), equation (39) becomes:

\[
W^2 f_p B_B P^a z_2 T^2 \left[ \left( 1 + x_c + 0.5x_c^2 + 0.25x_c^3 \right) \right] \]

\[
+ \left( 5 + 2x_c + 0.5x_c^2 \right) = \]
When the porous medium is horizontal, $S_2 = 0$ and $x_c = 0$ then from equation (40),

$$f_p = \frac{p_1^2}{W^2 \beta p a} \left( z_2 T_2 + 4.96 z_{\text{av}} T_{\text{av}} \right)$$

In an isothermal flow where there is no variation in $z$,

$$f_p = \frac{p_1^2 - p_2^2}{2 \left( \frac{a}{W} \right) \beta p z_2 T_2}$$

Example 4
The following data came from the book of (Giles et al., 2009) called “theory and problem of fluid mechanics and hydraulics”

$W = 0.75$ lb/sec of air, $R = 1544$, $L = 1800$ ft, $d = 4$ inch = 0.333333 ft,

$g = 32.2$ ft/sec$^2$, $z_2 = z_{\text{av}} = 1$ (air is fluid), $T_2 = T_{\text{av}} = 90^\circ F = 550^\circ R$

(Isothermal flow), $p_1 = 49.5$ psia $= 7128$ psf, $p_2 = 45.73$ psia $= 6585.12$ psf.

Pipe is horizontal.

(a) Calculate friction factor of the pipe ($f$)
(b) If the pipe were to be filled with a homogenous porous material having a porosity of 20% what would be the friction factor ($f_p$)?

Solution
(a) Let $\beta a$ be the equivalent $\beta p a$ by use of a pipe then.

$$\beta a = \frac{1.621139RL}{6g d^5 M} = \frac{1.621139 \times 1544 \times 1800}{6 \times 32.2 \times 0.333333 \times 28.97} = 195610.8241$$

$$f = \frac{p_1^2 - p_2^2}{6W^2 \beta a^2 z_2 T_2} = \frac{7128^2 - 6585.12^2}{6 \times 0.75^2 \times 195610.8241 \times 1 \times 550} = 0.20463$$

The calculated $f$ agrees with $f = 0.0205$ obtained by Giles et al., who used another equation.
(b) \( d_p = 0.333333 \times \sqrt{0.2} = 0.149071 \text{ft} \)

\[
\frac{\text{BB}_p}{a} = \frac{1.621139 \times RL}{6gd_p M} = \frac{1.621139 \times 1544 \times 1800}{6 \times 32.2 \times 0.149071^5} \times 28.97 = 10934995.62
\]

\[
f_p = \frac{p_1^2 - p_2^2}{6W^2 \text{BB}_p a z_2 T_2}
\]

\[
= \frac{7128 - 6585.12}{6 \times 0.75^2 \times 10934995.62 \times 2 \times 1 \times 550} = 3.667626 \text{E} - 4
\]

The equation for pressure transverse in a porous medium by use of Darcian lost head (equation (37) can be arranged as:

\[
W^2 \text{BB}_p b \left[ \frac{z_2 T_2}{k} \left( x_c + 0.5x_c^2 + 0.36x_c^3 \right) \right]
\]

\[
= \frac{p_1^2}{6} \left( 4.96 + 1.96x_c + 0.72x_c^2 \right) - \frac{S_L}{6} \left( 1 + x_c + 0.5x_c^2 + 0.3x_c^3 \right)^2
\]

\[
(43)
\]

Where

\[
\text{BB}_p = \frac{2c \mu RL}{6A_p M} = \frac{2.576479 \mu RL}{6 d_p M}.
\]

www.intechopen.com
$S_2 = \frac{2M \sin \theta P_2}{z_2 T_2 R}$

$x_c = \frac{2M \sin \theta L}{z_{av} T_{av} R}$

$z_{av,c} = \text{Average gas deviation factor calculated with } p_{av,c} \text{ and } T_{av}$

$p_{av,c} = \sqrt{\frac{p_1^2 + p_2^2}{2}}$

When the porous medium is horizontal, $S_2 = 0$, and $x_c = 0$, then,

$$k = \frac{W^2 BB_p b}{(p_1^2 - p_2^2)} \left[ \frac{z_2 T_2 (1 + x_c + 0.5x_c^2 + 0.25x_c^3)}{p_1^2 - p_2^2} + z_2 T_2 (5 + 2x_c + 0.5x_c^2) \right]$$

$$= \left[ p_2 \frac{p_1^2}{6} \left( 5x_c + 2x_c^2 + 0.5x_c^3 \right) \right]$$

$$= \frac{S_2 L}{6} \left( 1 + x_c + 0.5x_c^2 + 0.25x_c^3 \right)$$

When the porous medium is horizontal, equation (45) becomes

$$k = \frac{6WBB_p b z_2 T_2}{(p_1^2 - p_2^2)}$$

**Example 5**

The following problem came from the book of (Amyx et al., 1960). During a routine permeability test, the following data were obtained.
Flow rate (Q) = 1,000cc of air in 500sec.
Pressure down stream of core (p_2) = 1 atm. absolute
Flowing temperature (T) = 70°F
Viscosity or air at test temperature (μ) = 0.02c_p
Cross-sectional area of core (A_p) = 2cm²
Pressure upstream of core (p_1) = 1.45 atm absolute
Length of core (L_p) = 2cm

**Solution**

In oil field units in which pressure is in atmospheres and temperature is expressed in degree Kelvin, R = 82.1

Here, T = 70°F = (70 + 460)°R = 530 R

= 294.4 0 K

Q = 1000 cc / 500 sec = 2 cc / sec

z_1 = z_2 = z_{av} = 1 (air is fluid)

The volumetric flow rate can be converted to weight flow rate by:

\[ W = \gamma Q \text{ where } \gamma = \frac{pM}{zTR} \]

Substituting given values

\[ W = \frac{1 \times 28.97 \times 2}{1 \times 82.1 \times 294.4} = 0.002397163 \text{ gm / sec} \]

Taking the core to be horizontal

\[ k = \frac{6wBB_p b z_2 T_2}{p_{1}^2 - p_{2}^2} \quad \text{where} \]

\[ BB_p b = \frac{2\mu RL}{6A_p M}, (c' = 1 \text{ in a consistent set of units}) \]

\[ 2 \times 0.02 \times 82.1 \times 2 = \frac{1.889311E - 2}{6 \times 2 \times 28.97} \]

www.intechopen.com
Then

\[
k = \frac{6 \times 2.397163E - 3 \times 1.889311E - 2 \times 1 \times 294.4}{1.45^2 - 1^2} = 0.07256 \text{ darcy} = 72.56 \text{ millidarcy}
\]

Amyx, et al obtained the permeability of this core as 72.5md with a less rigorous equation.

**Horizontal and Downhill Gas Flow in Porous Media**

In downhill flow, the negative (-) sign in the numerator of equation (23) is used. Neglecting the kinetic effect, equation (23) becomes:

\[
\frac{dp^2}{d\rho P} = AA P - BP P^2
\]  
(47)

Where

\[
AA P = \frac{1.621139 M z TR}{\frac{gd}{p} M},
\]

\[
BP = \frac{2M \sin \theta}{z TR}
\]

By use of the Darcian lost head, the differential equation for downhill gas flow in porous media becomes.

\[
\frac{dp^2}{d\rho P} = AA' P - BP P^2
\]  
(48)

Where

\[
AA' = \frac{2c' M z TR}{Ap Mk} = \frac{2.546479 c' M z TR}{Ap Mk},
\]

\[
BP = \frac{2M \sin \theta}{z TR}
\]

**Solution to the differential equation for horizontal and downhill flow**

The Runge-Kutta numerical algorithm that was used to provide a solution to the differential equation for horizontal and uphill flow can also be used to solve the differential equation for horizontal and downhill flow. Application of the Runge - Kutta algorithm to equation (47) produces.

\[
p^2 = \sqrt{p^2 - \left[ \frac{p}{c} \right]^2}
\]  
(49)
Then millidarcy 72.56 darcy 0.7256.

Amyx, et al obtained the permeability of this core as 72.5 md with a less rigorous equation.

In downhill flow, the negative (-) sign in the numerator of equation (23) is used. Neglecting the kinetic effect, equation (23) becomes:

\[
\frac{dP}{A} = \frac{1}{A \beta_p} \left( \frac{5.2 - 2.2x_d - 0.6x_d^3}{6} \right) + \frac{u_p c}{6} \left( -5.2x_d + 2.2x_d^2 - 0.6x_d^3 \right)
\]

\[
AA_p = \frac{1.621139 f_p z_1 T_1 RW^2}{gd_p M},
\]

\[
S_1 = \frac{2M \sin \theta p_1^2}{z_1 T_1 R}
\]

\[
c_p = \frac{1.621139 f_p z_{av} T_{av} RW^2}{gd_p M},
\]

\[
x_d = \frac{2M \sin \theta L}{z_{av} T_{av} R}
\]

\[z_{av}^d = \text{Gas deviation factor (z) calculated}\]

with \(T_{av} = 0.5(T_1 + T_2)\)

and \(p_{av}^d = \sqrt{p_1^2 - AA_p c}\)

Other variables remain as defined in previous equations.

In equation (49), the parameter \(k_4\) in the Runge-Kutta algorithm is given some weighting to compensate for the variation of the temperature (T) and the gas deviation factor between the mid section and the exit end of the porous medium. In isothermal flow in which there is no significant variation of the gas deviation factor (z) between the midsection and the exit end of the porous medium, equation (49) becomes:

\[
p_2 = \sqrt{p_1^2 - \overline{y_c T}}
\]
Where

\[
\overline{y_{cT}} = aa_p c (1 - \dot{x}_d + 0.5x_d^2 - 0.35x_d^3)
\]

\[
+ \frac{p_1^2}{6} (-5.0x_d + 2.0x_d^2 - 0.7x_d^3)
\]

\[
+ \frac{u_p c}{6} (5.0 - 2.0x_d + 0.7x_d^2)
\]

Other variables in equation (50) remain as defined in equation (49).

Application of the Runge-Kutta algorithm to the downhill differential equation by use of Darcian lost head (equation (48)) gives

\[
p_2^2 = p_1^2 - |\overline{y_d}|
\]

Where

\[
\overline{y_d} = aa_p d (1 - x_e + 0.5x_e^2 - 0.3x_e^3)
\]

\[
+ \frac{p_1^2}{6} (-5.2x_e + 2.2x_e^2 - 0.6x_e^3)
\]

\[
+ \frac{u_p d}{6} (5.2 - 2.2x_e - 0.6x_e^2)
\]

\[
aa_p d = (AAp'/1 - S_l) L
\]

\[
AAp'/1 = \frac{2c' \mu z \hat{T}_1 RW}{A_p Mk}
\]

\[
= \frac{2.54679 c' \mu z_{av} e T_{av} RW}{d_p^2 Mk},
\]

www.intechopen.com
\[ S_2 = \frac{2M \sin \theta P^2}{z_1 T_1 R} \]

\[ x_c = \frac{2M \sin \theta L}{z_{av}^e T_{av} R}, \]

\[ u_p \frac{d}{d} = \frac{2c \mu_{av}^e T_{av} RW}{\mu_{av}^e T_{av} R} = 2.546479c \mu_{av}^e T_{av} RW d_p \frac{M}{M} \]

\[ z_{av}^e = \text{Gas deviation factor (z) calculated} \]

with \( T_{av} \) and \( p_{av}^e \)

\[ T_{av} = 0.5(T_1 + T_2) \]

\[ p_{av}^e = \sqrt{p_1^{\frac{2}{3}}} \left| a_{av} d \right| \]

Equation (49) can be written as:

\[ f_p W^2 \left[ J_p + \frac{S L}{6}(1-x_f + 0.5^2 x_f - 0.3 x_f^3) \right] \]

\[ BB_p^a \left[ Z_1 T_1 (1-x_f + 0.5 x_f^2 - 0.3 x_f^3) + XX \right] \]

Where \( XX = z_{av}^e f_{av}(5.2 - 2.2 x_f + 0.6 x_f^2) \)

\[ J_p = \frac{p_1^2}{6} \left( \frac{52 x_f + 22 x_f^2}{2} - 0.6 x_f^3 \right) \]

\[ J_p = \frac{p_2^2}{6} \left( \frac{52 x_f + 22 x_f^2}{2} - 0.6 x_f^3 \right) \]

\[ BB_p^a = \frac{1.621139 RL}{6g d_p^5 M} = \frac{0.270110 RL}{g d_p^5 M} \]

\[ S_1 = \frac{2 M \sin \theta P^2}{6g d_p^5 M}, x_f = \frac{2 M \sin \theta L}{z_{av}^e T_{av} R} \]
\( z_{av} = \) Gas deviation factor at the midsection of the porous medium calculated with 

\[
T_{av} \text{ and } P_{av}^f, \text{ where } T_{av} = 0.5(T_1 + T_2)
\]

and \( P_{av}^f = \frac{2P_1P_2}{P_1 + P_2} \)

During isothermal flow in which there is no significant variation of the gas deviation factors (\( z \)) between the midsection and the exit end of the porous medium, equation (52) can be written as:

\[
f_p^w = f_p B B^w \frac{J x x x \rho \mu}{z_2 T_1 \left( 1 - x_f + 0.5x_f^2 - 0.35x_f^3 \right) + z_1 T_1 \left( 5.0 - 2.0x_f + 0.7x_f^2 \right)}
\]

The variables in equation (53) remain as defined in equation (52)

**Example 6**

Suppose the porous medium of example 3b was vertical what would be the dimensionless friction factor by use of the same pressure as they were in example 3b?

**Solution**

Here, \( P_1 = 7128 \text{ psf}, P_2 = 6585.12 \text{ psf}, T_{av} = 550 \text{ R} \), \( W = 0.75 \text{ ft}^2/\text{sec} \), \( R = 1544 \), \( L_p = 1800 \text{ ft} \), \( g = 32.2 \text{ ft}^2/\text{sec}^2 \), \( d_p = 0.066667 \text{ ft} \), \( z_t = z_{av} = 1 \), since \( \theta = 90^\circ \), \( \sin 90^\circ = 1 \)

\[
x_f = \frac{2M \sin \theta L}{f} = \frac{2 \times 28.97 \times 1 \times 1800}{1 \times 550 \times 1544}
\]

\[= 0.122812
\]

The flow is isothermal; \( z \) is constant at 1.0 so equation (52) is used.

\[
1 - x_f + 0.5x_f^2 - 0.35x_f^3 = 0.884081
\]

\[
5.0 - 2.0x_f + 0.7x_f^2 = 4.764934
\]

\[-5.0x_f + 2.0x_f^2 + 0.7x_f^3 = 0.585191
\]

www.intechopen.com
Solution of Example 3b

During isothermal flow in which there is no significant variation of the gas deviation, the flow is isothermal, and \( z \) is constant at 1.0, so equation (52) is used.

Equation (52) can be written as:

\[
B_{B, p}^{a} = \frac{0.270110 RL}{8 dp^{5} M}
\]

\[
= \frac{0.270110 \times 1544 \times 1800}{32.2 \times 0.066667^{5} \times 28.97} = 611283.5.
\]

\[
S_{1} = \frac{2 M \sin \theta p^{2}}{z_{1} T_{1} R} = \frac{2 \times 28.97 \times 1 \times 7128^{2}}{1 \times 550 \times 1544} = 3466.601.
\]

If \( B_{B, p}^{a} > S_{1} \), then

\[
I_{p} = \frac{R_{1}^{2} \rho_{1}^{2}}{6} \left( \frac{5.0 x_{f} + 2.0 x_{f}^{2} - 0.07 x_{f}^{3}}{0.585191} \right) p_{2}^{2}
\]

\[
= 7128^{2} \times \frac{7128^{2}}{6} + 6585.12^{2} = 1240004
\]

\[
\frac{S_{1} L}{6} \left( 1 - x_{f} + 0.5 x_{f}^{2} - 0.35 x_{f}^{3} \right)
= \left( 3466.601 \times 1800 \times 0.884081 \right) / 6 = 919426.8859
\]

Then

\[
f_{p} = \frac{12400014 + 919426.8859}{0.75^{2} \times 611283825 \left( \left( 1 \times 550 \times 0.884081 \right) + \left( 1 \times 550 \times 4.764934 \right) \right)}
= 1.977439E6
\]

There is a drastic reduction in the \( f_{p} \) as compared to \( f_{p} = 6.560860 \) E-6 when the porous medium was horizontal. The effect of inclination becomes more severe as the porous medium gets longer.

Equation (40) can be written as:

\[
f_{p} = \frac{B_{B, p}^{a} W}{k} \left[ \xi_{1} T_{1} \left( 1 - x_{f} + 0.5 x_{f}^{2} - 0.3 x_{f}^{3} \right) + Z_{df} f_{T} \left( 5.2 - 2.2 x_{f} + 0.6 x_{f}^{2} \right) \right]
\]

\[
- \left[ I_{p} + \frac{S_{1} L}{6} \left( 1 - x_{f} + 0.5 x_{f}^{2} - 0.3 x_{f}^{3} \right) \right]
\]

Where

\[
I_{p} = \frac{R_{1}^{2}}{6} \left( \frac{5.0 x_{f} + 2.0 x_{f}^{2} - 0.07 x_{f}^{3}}{0.585191} \right) p_{2}^{2}, \text{if } B_{B, p}^{a} > S_{1}
\]
Example 7

Compute the permeability of the core of example 4 assuming that the case was vertical.

Solution

From example 4, \( W = \gamma Q \)

Substituting the given values, \( W = 0.00239716 \text{gm/sec} \)

\[ \sin \theta = \sin 90^\circ = 1.0, \ M = 28.97, \ L_p = 2\text{cm} \]

\[ p_1 = 1.45\text{atm}, \ p_2 = 1.0\text{atm}, \ \mu = 0.02\text{cp} \]

\[ z_{avf} = 2M \sin 0L \]

\[ x_f = \frac{2M \sin 0L}{2M \sin \theta} = \frac{2 \times 28.97 \times 2}{1 \times 294.4 \times 82.1} \]

\[ = 0.004794 \]

The flow is isothermal so equation (55) is used.
Steady State Compressible Fluid Flow in Porous Media

1 - x_f = 0.05x_f + 0.35x_f^2
5.0 - 2x_f = 0.7x_f + 0.70x_f^2
-5.0x_f = 2.0x_f - 0.70x_f^2
-2x_f = 6.0 - 2.2f
-2x_f = 2.5 - 6.0

BB_p^b > S_1, therefore,

J_p = \frac{2}{6} \left( \frac{2}{p_1} \left( 5.0x_f + 2.0x_f^2 - 0.7x_f^3 \right) \right) - \frac{2}{p_2} = 1.45^2 - \frac{1.45^2}{6} - 0.023941 = 1.110883

Substitution of given values into equation (54) gives

k = \frac{0.018893 \times 0.00239716 \times 1762.173888}{1.110883 + 0.001672 \times 71.734 \text{ millidarcy}}

Comparing 71.734 md with 72.562 md obtained when the core was considered horizontal, it is seen that inclination has reduced, the calculated permeability (k) by (72.562 - 71.734)/72.564 = 1.141093 percent

The longer the core, the more, the effect of inclination.

Example 8
Use the data of example 4 to calculate the dimensionless friction factor (f_p). Because of simplicity assume that the core is horizontal.
Solution

\[ p_1 = 1.45 \text{ atm} = 1.45 \times 14.7 \times 144 \text{ psf} \]
\[ = 3069.36 \text{ psf} \]
\[ p_2 = 1 \text{ atm} = 14.7 \times 144 \text{ psf} = 2116.80 \text{ psf} \]
\[ z_2 = 1, T_2 = 530 \text{ R}, \theta = 0.2 \]
\[ L_p = 2 \text{ cm} = 2 / 2.54 \text{ in} = 2 \left( 2.54 \times 12 \right) \text{ ft} \]
\[ M = 28.97, g = 32.2 \text{ ft/sec}^2 \]
\[ A_p = 2 \times 0.2 \text{ cm}^2 = 0.4 \text{ cm}^2, R = 1545 \]
\[ d_p = 1.128379 \sqrt{A_p} = 0.713650 \text{ cm} \]
\[ = 0.023414 \text{ ft} \]
\[ \gamma_b = \frac{p_b M}{z_b T_b R} = \frac{1 \times 14.7 \times 28.97}{1 \times 530 \times 1545} \]
\[ = 0.074890 \text{ ft/lbf} \]
\[ Q_b = 2 \text{ cm}^3 / \text{ sec} = 2 \times 3.531467 \times 10^{-5} \text{ ft}^3 / \text{ sec} \]
\[ W = \gamma_b Q_b = 5.289431 \times 10^{-6} \text{ lbf/sec} \]
\[ \mu = 0.02 \times 2.088543 \times 10^{-5} \text{ lbf sec/ft}^2 \]
\[ = 4.177086 \times 10^{-7} \text{ lbf sec/ft}^2 \]
\[ \frac{N_{p a}}{6gd_p M} = \frac{1.621139 \times 1545 \times 0.0656168}{6 \times 32.2 \times 0.023414 \times 28.97} \]
\[ = 417282 \]
The coordinate \((R_{Np}, f_p) = (21.385242, 0.0133065E8)\) locates very well in a previous graph of \(f_p\) versus \(R_{Np}\) that was generated by (Ohirhian, 2008). The points plotted in the graph were obtained by flowing water through synthetic tight consolidated cores. The plot is reproduced here as follows.

**Plot of \(f_p\) versus \(R_{Np}\) for Porous Media**

**Assignment**

Use the data of example 4 to calculate the dimensionless friction factor \((f_p)\) considering the core to be vertical

**Conclusions**

1. The Darcy law as presented in API code 27 has been derived from the laws of fluid mechanics.
2. New general differential equations applicable to horizontal, uphill and downhill flow of gas through porous media have been developed.
3. The Runge-Kutta algorithm has been used to provide accurate solutions to the differential equations developed in this work.
4. The solution to the differential equation shows that inclination has the effect of reducing laboratory measured values of gas permeability and dimensionless friction factor. The longer a core the more the reduction of measured permeability / dimensionless friction factor.
Nomenclature

dp = Incremental pressure drop

dℓp = Incremental length of porous medium

Q = Volumetric flow rate

V = Average velocity flowing fluid

Kp = Proportionality constant that is dependent on both fluid and rock properties

k = Permeability of porous medium

µ = Absolute viscosity of flowing fluid

ρ = Mass density of flowing fluid

g = Acceleration due to gravity

Z = Elevation of the porous medium above a datum. The + sign is used where the point of interest is above the datum and the – sign is used where the chosen point is below the datum

µ' = Effective viscosity of flowing fluid = \( \frac{\mu}{\phi} \)

p = Pressure

γ = Specific weight of flowing fluid

v = Average fluid velocity

g = Acceleration due to gravity in a consistent set of units.

dℓp = Incremental length of porous medium

θ = Angle of porous medium inclination with the horizontal, degrees

dh = Incremental lost head

c = Dimensionless constant which is dependent on the pore size distribution of porous medium

c1 = Constant used for conversion of units. It is equal to 1 in a consistent set of units

dp = Diameter of porous medium = \( d\sqrt{\phi} \)

d = Diameter of cylindrical pipe

ϕ = Porosity of medium

fp = Dimensionless friction factor of porous medium that is dependent on the Reynolds number of porous medium.

RNP = Reynolds number of isotropic porous medium

Ap = Cross-sectional area of porous medium

W = Weight flow rate of fluid

γb = Specific weight of fluid at Pb and Tb

Qb = Volumetric rate of fluid, measured at Pb and Tb
Nomenclature

\( p_d \) = Incremental pressure drop

\( z_b \) = Gas deviation factor at \( p_b \) and \( T_b \) usually taken as 1

\( G \) = Specific gravity of gas (air = 1) at standard condition

\( M \) = Molecular weight of gas

\( R \) = Universal gas constant

\( A_1 \) = Pipe cross-sectional area at point 1

\( v_1 \) = Average fluid velocity at point 1

\( \gamma_1 \) = Specific weight of fluid at point 1

\( A_2 \) = Pipe cross-sectional area at point 2

\( v_2 \) = Average fluid velocity at point 2

\( \gamma_2 \) = Specific weight of fluid at point 2

\( T \) = Absolute temperature

\( K \) = Constant for calculating the compressibility of a real gas

\( p_1 \) = Pressure at inlet end of porous medium

\( p_2 \) = Pressure at exit end of porous medium

\( \theta \) = Angle of inclination of porous medium with horizontal in degrees.

\( z_2 \) = Gas deviation factor at exit end of porous medium.

\( T_1 \) = Temperature at inlet end of porous medium

\( T_2 \) = Temperature at exit end of porous medium

\( T_{a,v} \) = Average gas deviation factor evaluated with \( T_{a,v} \) and \( p_{a,v} \)

\( T_{a,v} \) = Arithmetic average temperature of the porous medium given by \( 0.5(T_1 + T_2) \) and \( p_{a,v} \)

\( \rho_{a} \) = Specific weight of fluid at point 1

\( \rho_{b} \) = Specific weight of fluid at point 2

\( \phi \) = Dimensionless friction factor of porous medium that is dependent on both fluid and rock properties

\( \frac{\phi}{\phi_{c}} \) = Porosity of medium

\( k \) = Proportionality constant that is dependent on both fluid and rock properties

\( \mu \) = Absolute viscosity of flowing fluid

\( \rho \) = Mass density of flowing fluid

\( \phi \) = Dimensionless constant which is dependent on the pore size

\( \theta \) = Angle of porous medium inclination with the horizontal in degrees.

\( \mu \) = Incremental length of porous medium

\( b \) = Diameter of porous medium

\( d \) = Diameter of cylindrical pipe

\( g \) = Acceleration due to gravity in a consistent set of units.

\( v \) = Average fluid velocity

\( Q \) = Volumetric rate of fluid, measured at point P

\( W \) = Weight flow rate of fluid

\( \gamma \) = Specific weight of fluid at point P

\( L \) = Constant used for conversion of units. It is equal to 1 in a consistent set of units

Reference

www.intechopen.com
The contributions in this book present an overview of cutting edge research on natural gas which is a vital component of world’s supply of energy. Natural gas is a combustible mixture of hydrocarbon gases, primarily methane but also heavier gaseous hydrocarbons such as ethane, propane and butane. Unlike other fossil fuels, natural gas is clean burning and emits lower levels of potentially harmful by-products into the air. Therefore, it is considered as one of the cleanest, safest, and most useful of all energy sources applied in variety of residential, commercial and industrial fields. The book is organized in 25 chapters that cover various aspects of natural gas research: technology, applications, forecasting, numerical simulations, transport and risk assessment.
