1. Introduction

Much attention has recently been given to statement and investigation of new problems for the models of heat and mass transfer. The control problems for Navier-Stokes and Oberbeck–Boussinesq equations are examples of such kind problems. This interest to control problems is connected with a variety of technical applications in science and engineering such as the crystal growth process, the aerodynamic drag reduction, the suppression of a turbulence and mass flow separation. In control problems the unknown densities of boundary or distributed sources, the coefficients of model differential equations or boundary conditions are recovered from minimum of certain cost functionals depending on controls and state (the solution to the original boundary value problem). The number of papers is devoted to study of control problems for models of heat and mass transfer. We mention in particular papers (Gunzburger et al., 1991; 1993; Ito & Ravindran, 1998; Alekseev, 1998a;b; Alekseev & Tereshko, 1998a;b; Capatina & Stavre, 1998; Lee & Imanuvilov, 2000a;b; Lee, 2003) devoted to theoretical study of control problems for stationary Oberbeck–Boussinesq equations.

Along with control problems, the inverse problems for models of heat and mass transfer play an important role. Importantly, these inverse problems can be reduced to corresponding control problems by choosing a suitable minimized cost functional that adequately describes the inverse problem in question (Alekseev, 2000; Alekseev & Adomavichus, 2001; Alekseev, 2001; 2002; 2006; 2007a;b; Alekseev et al., 2008; Alekseev & Soboleva, 2009; Alekseev & Tereshko, 2010a). As a result, both control and inverse problems can be analyzed by applying a unified approach based on the constrained optimization theory in Hilbert or Banach spaces. These theoretical results, the increasing power of computers and the development of numerical methods for the flow simulation itself motivate the numerical study of the optimal flow control problems under consideration.

Oberbeck–Boussinesq equations are the most often used model of convection. Rigorous derivation of these equations from full model of viscous compressible heat conducting fluid can be found in (Gershuni & Zhukhovitskii, 1976; Joseph, 1976). Limits of applicability of this model are indicated in (Pukhnachev, 1992) for heat convection description and in (Perera & Sekerka, 1997) for concentration convection. In these papers new models of convection with non-solenoidal velocity field were proposed. In (Pukhnachev, 2004) the hierarchy of thermal gravitational convection models in closed domains, including the
traditional Oberbeck–Boussinesq equations, was constructed using the asymptotic expansions of the original equations with respect to the parameters of weak compressibility and microconvection. This theory was further developed in (Andreev et al., 2008). It is shown there that the non-solenoidal effect results in a minor correction to the velocity field in the case of steady flows. At the same time, there are significant differences in predictions of classical and new models for dramatically unsteady flows, caused by large gradients of the initial temperature field or by long-term time-periodic changes in the boundary temperature regime. These differences are most noticeable in the case when the microconvection parameter \( \eta = g \beta / (\nu \lambda_1) \) has the order one. Here \( g \) is the acceleration of gravity, \( l \) is the characteristic linear scale, \( \lambda_1 \) is the thermal diffusivity.

Let \( \Omega \) be a bounded domain in the space \( \mathbb{R}^d \) (\( d = 2, 3 \)) with a Lipschitz boundary \( \Gamma \) consisting of two parts \( \Gamma_D \) and \( \Gamma_N \). In this chapter we consider the model of heat and mass transfer in a viscous incompressible heat conducting fluid. The model consists of the Navier-Stokes equations and the convection-diffusion equations for the substance concentration and the temperature that are nonlinearly related via buoyancy in the Oberbeck–Boussinesq approximation and via convective mass and heat transfer. It is described by the equations

\[
- \nu \Delta u + (u \cdot \nabla)u + \nabla p = f + (\beta_C C - \beta_T T) \mathbf{G}, \quad \text{div} \, u = 0 \text{ in } \Omega, \quad u = g \text{ on } \Gamma, \quad (1)
\]

\[
- \lambda \Delta C + u \cdot \nabla C + kC = f \text{ in } \Omega, \quad C = \psi \text{ on } \Gamma_D, \quad \lambda \partial C / \partial n = \chi \text{ on } \Gamma_N, \quad (2)
\]

\[
- \lambda_1 \Delta T + u \cdot \nabla T = f_1 \text{ in } \Omega, \quad T = \varphi \text{ on } \Gamma_D, \quad \lambda_1 (\partial T / \partial n + \kappa T) = \eta \text{ on } \Gamma_N. \quad (3)
\]

Here \( u, T \) and \( C \) denote the velocity, temperature and substance concentration fields respectively, \( p = P / \rho \) where \( P \) is a pressure and \( \rho = \text{const} \) is the density of medium, \( \nu \) is the kinematic viscosity coefficient, \( f \) is the mass density of body forces, \( \mathbf{G} \) is the gravitational acceleration vector, \( k \) is the coefficient of decomposition of the substance due to chemical reactions, \( f_1 \) and \( f_1 \) are volume densities of the substance and heat sources, \( \beta_C \) is the volumetric thermal expansion coefficient, \( \beta_T \) is the solutal expansion coefficient, \( \lambda_1 \) and \( \lambda_1 \) are the diffusivity and thermal diffusivity coefficients, \( g \) is a given vector-function on \( \Gamma \), \( \psi \) and \( \varphi \) are given functions on a part \( \Gamma_D \) of \( \Gamma \), \( \chi \) and \( \eta \) are functions given on another part \( \Gamma_N = \Gamma \setminus \Gamma_D \) of \( \Gamma \), \( n \) is the unit outer normal. We note that all the quantities in (1)–(3) are dimensional and their dimensions are defined in terms of SI units.

Hereinafter it is assumed that the parameters \( \nu, \lambda, \lambda_1, \beta_C, \beta_T, k \) are constants. This assumption is physically justified if the temperature \( T \) varies in a small range (Batchelor, 2000). The temperature change has the greatest influence on the viscosity. For example the viscosity of water decreases by more than twice during heating from 1°C to 99°C. As to the solvability of the boundary value problems for thermal convection model with temperature-dependent transport coefficients see (Goncharova, 2002) and references therein. Group-theoretical properties of the equations of this model and their exact solutions are considered in (Andreev et al., 1998). We note the anomalous property of water concerning with the nonmonotonic dependence of density on temperature near \( T \approx 4°C \). The dependence of parameters in equations (1)–(3) on the substance concentration \( C \) is less significant. It should be noted also that the applicability of our concentration convection model is limited to small values of concentration \( C \).

In the special case where \( \beta_T = 0 \) and \( k = 0 \) problem (1)–(3) splits into two: problem (1), (2) for the mass transfer model in the Oberbeck–Boussinesq approximation (see (Joseph, 1976)), and the linear boundary value problem (3) (for given \( u \)) for temperature \( T \), which describes
the convection-diffusion of a heat. We shall refer to problem (1), (2) at $\beta_T = 0$ as Model 1. In another special case where $\beta_C = 0$ problem (1)–(3) splits into problem (1), (3) for a heat transfer model in the Oberbeck–Boussinesq approximation (see (Joseph, 1976)), and the linear boundary value problem (2) for substance concentration $C$. We shall refer to problem (1), (3) at $\beta_C = 0$ as Model 2. Finally problem (1)–(3) itself is referred to as Model 3.

Our goal is the study of the boundary control problems for the models under consideration. The problems consist in minimization of certain cost functionals depending on the state and controls. In order to formulate a boundary control problem for Model 1 we divide the set of all data of Model 1 into two groups: the group of controls containing the functions $g \in H^{1/2}(\Gamma)$ and $\chi \in L^2(\Gamma_N)$, which play the role of controls, and the group of fixed data comprising the invariant functions $f, f, k, \beta_C$ and $\psi$. We assume that the controls $g$ and $\chi$ vary in some closed convex sets $K_1 \subset H^{1/2}(\Gamma)$ and $K_2 \subset L^2(\Gamma_N)$. The mathematical statement of the boundary control problem for Model 1 is as follows: to find a pair $(x, u)$, where $u = (g, \chi) \in K = K_1 \times K_2$, $x = (u, p, C) \in X = H^1(\Omega) \times L^2(\Omega) \times H^1(\Omega)$ such that $F(x, u) = 0$ and

$$f(x, g, \chi) \equiv \frac{\mu_0}{2} I(x) + \frac{\mu_1}{2} \|g\|^2_{H^{1/2}(\Gamma)} + \frac{\mu_2}{2} \|\chi\|^2_{L^2(\Gamma_N)} \to \inf.$$  

Here $F(x, u) = 0$ is the operator constraint in the form of a weak formulation of Model 1; $\mu_0$, $\mu_1$, $\mu_2$ are nonnegative constants, $I(x)$ is a cost functional.

Similar boundary control problems can be formulated for Models 2 and 3. We divide the set of all data of Model 2 into two groups: the group of controls containing the functions $g \in H^{1/2}(\Gamma)$ and $\eta \in L^2(\Gamma_N)$ and the group of fixed data comprising the invariant functions $f, f, \beta_T, a$ and $\varphi$. It is assumed that the controls $g$ and $\eta$ vary in some closed convex sets $K_1 \subset H^{1/2}(\Gamma)$ and $K_3 \subset L^2(\Gamma_N)$. A boundary control problem for Model 2 consists of finding a pair $(x, u)$, where $u = (g, \eta) \in K = K_1 \times K_3$, $x = (u, p, T) \in X = H^1(\Omega) \times L^2(\Omega) \times H^1(\Omega)$ such that $G(x, u) = 0$ and

$$f(x, g, \eta) \equiv \frac{\mu_0}{2} I(x) + \frac{\mu_1}{2} \|g\|^2_{H^{1/2}(\Gamma)} + \frac{\mu_3}{2} \|\eta\|^2_{L^2(\Gamma_N)} \to \inf. \quad (4)$$

Here $G(x, u) = 0$ is the operator constraint in the form of a weak formulation of Model 2, $\mu_0$, $\mu_1$, $\mu_3$ are nonnegative constants. Finally, a boundary control problem for Model 3 consists of finding a pair $(x, u)$, where $u = (g, \chi, \eta) \in K = K_1 \times K_2 \times K_3$, $x = (u, p, C, T) \in X = H^1(\Omega) \times L^2(\Omega) \times H^1(\Omega) \times H^1(\Omega)$ such that $H(x, u) = 0$ and

$$f(x, g, \chi, \eta) \equiv \frac{\mu_0}{2} I(x) + \frac{\mu_1}{2} \|g\|^2_{H^{1/2}(\Gamma)} + \frac{\mu_2}{2} \|\chi\|^2_{L^2(\Gamma_N)} + \frac{\mu_3}{2} \|\eta\|^2_{L^2(\Gamma_N)} \to \inf. \quad (5)$$

Here $H(x, u) = 0$ is the operator constraint in the form of a weak formulation of Model 3. The work consists of two parts. In the first part the solvability theorems for boundary control problems under study are formulated and proved. Optimality systems describing the first-order necessary optimality conditions are derived and analyzed. Sufficient conditions to the data ensuring the local uniqueness and stability of optimal solutions for concrete tracking-type functionals are established. The local uniqueness conditions are rather cumbersome. To simplify them, we introduce analogues of dimensionless parameters widely used in fluid dynamics, namely, the Reynolds number and the diffusion or temperature Rayleigh and Prandtl numbers. In terms of these parameters, the uniqueness conditions can be written in a relatively simple form and are similar to those for the coefficient inverse problems for the stationary linear convection-diffusion-reaction equation (see e.g. (Alekseev & Tereshko, 2008)).
In the second part a numerical algorithm based on Newton’s method for the optimality system and finite element method for linearized boundary value problems is formulated and analyzed. Some computational results connected with the vortex reduction in the steady 2D viscous fluid flow around a cylinder in a channel by means of the temperature and hydrodynamic controls on some parts of the boundary are given and discussed. The details of theoretical and numerical studies can be found in (Aleksiev & Tereshko, 2008).

2. Statement of boundary control problem for mass transfer model

We begin our study with consideration of Model 1 having in denitions of Sect. 1 the form
\[ -\nu \Delta u + (u \cdot \nabla)u + \nabla p = f + \beta C \Gamma, \quad \text{div} u = 0 \text{ in } \Omega, \quad u = g \text{ on } \Gamma, \]
\[ -\lambda \nabla C + u \cdot \nabla C + kC \Gamma = f, \quad C = \psi \text{ on } \Gamma_D, \quad \lambda \partial C / \partial n = \chi \text{ on } \Gamma_N. \]

Under theoretical study of control problems for Model 1 we shall use the Sobolev spaces \( H^r(\Omega) \) with \( s \in \mathbb{R} \) and the spaces \( L^r(\Omega) \) with \( r \geq 2 \) where \( D \) denotes \( \Omega \), its subset \( \Gamma \) or its part \( \Gamma_0 \) with positive measure. The corresponding spaces of vector functions are denoted by \( \mathbf{H}^r(\Omega) \) and \( \mathbf{L}^r(\Omega) \). The norms and inner products in \( H^r(\Omega) \), \( H^r(\Gamma) \) and in their vector analogues are denoted by \( \| \cdot \|_{r,\Omega}, \| \cdot \|_{r,\Gamma} \) and \( (\cdot,\cdot)_{r,\Omega}, (\cdot,\cdot)_{r,\Gamma} \). The inner products and norms in \( L^2(\Omega) \) or in \( L^2(\Omega) \) are denoted by \((\cdot,\cdot)\) and \( \| \cdot \| \). If \( Q = \Omega \) then we set \( \| \cdot \|_{\Omega} = \| \cdot \| \). The inner product and norm in \( L^2(\Gamma_N) \) are denoted by \((\cdot,\cdot)_{\Gamma_N}\) and \( \| \cdot \|_{\Gamma_N} \). The norm and seminorm in \( H^1(\Omega) \) or in \( H^1(\Omega) \) are denoted by \( \| \cdot \|_1 \) and \( | \cdot |_1 \). The duality relation for the pair of dual spaces \( X \) and \( X^* \) is denoted by \((\cdot,\cdot)_{X \times X^*}\) or simply \((\cdot,\cdot)\). Let the following assumptions hold:

(i) \( \Omega \) is a bounded domain in \( \mathbb{R}^d \), \( d = 2,3 \) with a boundary \( \Gamma \in C^{0,1} \) consisting of \( N \) connected components \( \Gamma_1, \Gamma_2, \ldots, \Gamma_N \). The open segments \( \Gamma_i \) and \( \Gamma_i \) of \( \Gamma \) obey the conditions \( \Gamma_i \subseteq C^{0,1}, \Gamma_1 \neq \emptyset, \Gamma_1 \cap \Gamma_i = \emptyset, \Gamma = \Gamma_1 \cup \Gamma_i \).

Let \( D(\Omega) \) be the space of infinitely differentiable finite in \( \Omega \) functions, \( H_0^1(\Omega) \) be a closure of \( D(\Omega) \) in \( H^1(\Omega) \), \( H_0^1(\Omega) = H_0^1(\Omega) \), \( V = \{ v \in H_0^1(\Omega) : \text{div} \ v = 0 \} \), \( H^{-1}(\Omega) = H^1_0(\Omega)^* \), \( L^2(\Omega) = \{ p \in L^2(\Omega) : (p,1) = 0 \} \), \( T = H^1(\Omega, \Gamma) \equiv \{ S \in H^1(\Omega) : S|_{\Gamma_0} = 0 \} \), \( L^2(\Omega) = \{ u \in L^2(\Omega) : u \geq 0 \} \). We shall use the following inequalities which are implied by the embedding theorems and the continuity of the trace operator:

\[ \| u \|_{L^q(\Omega)} \leq c_{L^q} \| u \|_{L^1(\Omega)}, \| \text{rot} u \| \leq c_{\text{rot}} \| u \|_{L^1(\Omega)}, \| u \|_{H^{1/2,\Gamma}} \leq c_{1/2,\Gamma} \| u \|_{H^1(\Omega)} \forall u \in H^1(\Omega). \]

Here \( c_{L^q}, c_{\text{rot}}, c_{1/2,\Gamma} \) are constants depending on \( \Omega \).

Together with \( H^1(\Omega) \) and \( H^{1/2}(\Gamma) \) we shall consider their closed subspaces \( \hat{H}^1(\Omega) = \{ u \in H^1(\Omega) : u \cdot \text{n}|_{\Gamma_0} = 0, (u,\text{n})_{\Gamma_1} = 0, i = 1, N \} \), \( \hat{H}^1(\Gamma) = \{ v \in H^1(\Omega) : \text{div} v = 0 \} \), \( \hat{H}^1(\Omega) = \{ v \in H^1(\Omega) : \text{div} v = 0 \} \), \( \hat{H}^{1/2}(\Gamma) = \{ u \in H^1(\Omega) \} \), and also duals \( H^1(\Omega)^* \), \( H^{1/2}(\Gamma)^* \) of the spaces \( H^1(\Omega) \), \( H^{1/2}(\Gamma) \). Let us introduce the following bilinear and trilinear forms: \( a_0 : H^1(\Omega)^2 \to \mathbb{R}, b : H^1(\Omega) \times L^2(\Omega) \to \mathbb{R}, a_1 : H^1(\Omega)^2 \to \mathbb{R} \), \( b_1 : H^1(\Omega) \times H^1(\Omega) \to \mathbb{R} \), \( c : H^1(\Omega) \to \mathbb{R}, c_1 : H^1(\Omega) \times H^1(\Omega) \times H^1(\Omega) \to \mathbb{R} \) by

\[ a_0(u,v) = (\nabla u, \nabla v), b(v,q) = (\text{div} v, q), c(u,v,w) = (u \cdot \text{grad} v, w), \]

\[ a_1(C,S) = (\nabla C, \nabla S), b_1(S,v) = (bS, v), c_1(u,C,S) = (u \cdot \nabla C, S), \quad b = \beta_C G. \]
We note that forms $c$ and $c_1$ possess the next properties (Alekseev & Tereshko, 2008; Girault & Raviart, 1986):

$$c(u, v, w) = -c(w, u, v), \ c(u, v, v) = 0 \ \forall u \in H^1_\text{div}(\Omega), \ (v, w) \in H^1_0(\Omega) \times H^1(\Omega), \quad (8)$$

$$c_1(u, C, S) = -c_1(u, S, C), \ c_1(u, C, C) = 0 \ \forall u \in H^1_\text{div}(\Omega), (C, S) \in \mathcal{T} \times H^1(\Omega). \quad (9)$$

Besides all the forms are continuous and the following lemma holds (Alekseev & Tereshko, 2008).

**Lemma 1.** Under conditions (i) there exist constants $\delta_0, \delta_1, \gamma_0, \gamma_1, \gamma_2$ and $\beta_1$ depending on $\Omega$ such that

$$|a_0(u, v)| \leq \|u\|_1 \|v\|_1 \ \forall (u, v) \in H^1(\Omega)^2, \ a_0(u, v, v) \geq \delta_0 \|v\|^2_1 \ \forall v \in H^1_0(\Omega),$$

$$|a_1(C, S)| \leq \|C\|_1 ||S||_1 \ \forall (C, S) \in H^1(\Omega) \times H^1(\Omega), \ a_1(C, C) \geq \delta_1 ||C||^2_1 \ \forall C \in \mathcal{T},$$

$$|c(u, v, w)| \leq \gamma_0 \|u\|_1 \|v\|_1 \|w\|_1 \ \forall (u, v, w) \in H^1(\Omega)^3,$$

$$|c_1(u, C, S)| \leq \gamma_1 \|u\|_1 \|C\|_1 ||S||_1 \ \forall u \in H^1(\Omega), \ (C, S) \in H^1(\Omega) \times H^1(\Omega),$$

$$|b_1(C, v)| \leq \beta_1 \|C\|_1 ||v||_1 \ \forall C \in H^1(\Omega), \ v \in H^1_0(\Omega),$$

$$|(\chi, C)_{r_{\chi}}| \leq \|\chi\|_1 ||r_{\chi}|| \leq \gamma_2 \|\chi\|_1 ||r_{\chi}|| \ \forall C \in H^1(\Omega).$$

Bilinear form $b(\cdot, \cdot)$ satisfies inf-sup condition

$$\inf_{\psi \in L^2(\Omega), \varphi \neq 0} \sup_{v \in H^1_0(\Omega), v \neq 0} \frac{b(v, \psi)}{||v||_1 ||\psi||} \geq \beta = \text{const} > 0. \quad (16)$$

Let in addition to (i) the following conditions take place:

(ii) $f \in H^{-1}(\Omega), \ b \in L^2(\Omega), \ f \in L^2(\Omega), \ k = L^2_0(\Omega), \ \psi \in H^{1/2}(\Gamma_D)$;

(iii) $g \in \bar{H}^{1/2}(\Gamma), \ \chi \in L^2(\Gamma_N)$.

In order to formulate an extremum problem for Model 1 we divide the set of all input data in problem (5), (6) into two groups. One consists of control functions $g$ and $\chi$, and the other consists of fixed data, namely $f, b, f, k$ and $\psi$. Assume that controls $g, \chi$ vary over some sets $K_1$ and $K_2$ such that

(j) $K_1 \subset \bar{H}^{1/2}(\Gamma), \ K_2 \subset L^2(\Gamma_N)$ are nonempty convex closed subsets.

Let $X = H^1(\Omega) \times L^2_0(\Omega) \times \bar{H}^{1/2}(\Gamma), \ Y = H^{-1}(\Omega) \times H^{1/2}(\Gamma) \times H^1(\Omega) \times H^1(\Omega) \times H^1/2(\Gamma_D), \ x = (u, p, C) \in X$. Introduce an operator $F \equiv \{F_1, F_2, F_3, F_4, F_5\} : X \times K_1 \times K_2 \rightarrow Y$, defined by

$$\langle F_1(x, u, v) \rangle = \nu a_0(u, v) + c(u, u, v) + b(v, p) - b_1(C, v) - (f, v),$$

$$\langle F_2(x, u, r) \rangle = b(u, r) - (\div u, r), \ F_3(x, u) = u|_{\Gamma} - g, \ F_2(x, u) = C|_{\Gamma_D} - \psi,$$

$$(F_4(x, u), S) = \lambda a_1(C, S) + (kC, S) + c_1(u, C, S) - (f, S) - (\chi, S)|_{\Gamma_N}.$$

We multiply the first equation in (5) by $v \in H^1_0(\Omega)$, the equation in (6) by $s \in \mathcal{T}$, integrate the results over $\Omega$ with use of Green formulas, and use boundary conditions in (5), (6) to obtain a
weak formulation of problem 1. It consists of finding a triple \( x = (u, p, C) \in X \) satisfying the relations
\[
\nu a_0(u, v) + c(u, u, v) + b(v, p) - b_1(C, v) = (f, v) \quad \forall v \in H_0^1(\Omega),
\]
\[
\lambda a_1(C, S) + (kC, S) + c_1(u, C, S) = (l, S) \equiv (f, S) + (\chi, S)_\Gamma \quad \forall S \in \mathcal{T},
\]
\[
\text{div} \, u = 0 \quad \text{in} \, \Omega, \quad u|_{\Gamma} = g, \quad C|_{\Gamma} = \psi,
\]
(17) (18) (19)

which one can rewrite in an equivalent form of the operator equation
\[
F(x, u) \equiv F(u, p, C, g, \chi) = 0.
\]
(20)

This triple \( (u, p, C) \in X \) will be called the weak solution to problem (5), (6).

Let \( I : X \to \mathbb{R} \) be a weakly lower semicontinuous cost functional. Setting \( K = K_1 \times K_2, u = (g, \chi), u_0 = (f, b, f, k, p) \) we formulate the following constrained minimization problem
\[
I(x, u) = \left( \mu_0 / 2 \right) I(x) + \left( \mu_1 / 2 \right) \| u \|^2_{L^2(\Omega)} + \left( \mu_2 / 2 \right) \| \chi \|^2_{H^1(\Omega)} \to \inf, \quad F(x, u) = 0, \quad (x, u) \in X \times K.
\]
(21)

Here \( \mu_0 > 0 \) and \( \mu_1 \geq 0, \mu_2 \geq 0 \) are positive dimensional parameters which serve to regulate the relative importance of each of the terms in (21). Another purpose of introducing \( \mu_1 \) is to ensure the uniqueness and stability of solutions to control problems under consideration (see below). The possible cost functionals are defined as
\[
I_1(x) = \| v - v_d \|^2_{L^2(\Omega)}, \quad I_2(x) = \| v - v_d \|^2_{L^2(\Omega)}, \quad I_3(x) = \| \text{rot} \, v - \eta_d \|^2_{L^2(\Omega)}.
\]
(22)

According to general theory of extremum problems (see (Ioffe & Tikhomirov, 1979)) we introduce an element \( \gamma^* = (\xi, \sigma, \zeta, \theta, \zeta^*) \in Y^* = H_0^1(\Omega) \times L_0^2(\Omega) \times H^{1/2}(\mathcal{T})^* \times \mathcal{T} \times H^{1/2}(\Gamma_D)^* \) which is referred to as the adjoint state and define the Lagrangian \( \mathcal{L} : X \times K \times \mathbb{R}^+ \times Y^* \to \mathbb{R} \)

where \( \mathbb{R}^+ = \{ \lambda \in \mathbb{R} : \lambda \geq 0 \} \), by the formula
\[
\mathcal{L}(x, u, \lambda_0, y^*) = \lambda_0 I(x, u) + \langle F_1(x, u, \xi), \xi \rangle + \langle F_2(x, u, \sigma), \sigma \rangle + \langle F_3(x, u, \zeta), \zeta \rangle + \langle F_4(x, u, \theta), \theta \rangle + \langle F_5(x, u, \psi), \psi \rangle + \langle F_6(x, u, \zeta^*), \zeta^* \rangle,
\]
Here \( (\xi, \sigma, \zeta, \theta, \psi) \in Y^* \) for \( \xi \in H_0^1(\mathcal{T})^* \), \( \zeta \in H^{1/2}(\mathcal{T})^* \), \( \theta \in \mathcal{T} \) and \( \psi \in H^{1/2}(\Gamma_D)^* \) is a dimension parameter. Let the dimension \( |\xi| \) be chosen so that the dimensions of \( \xi, \sigma, \theta \) at the adjoint state \( y^* \) coincide with those at the basic state \( x = (u, p, C) \) i.e.
\[
|\xi| = |u| = L_0 T_0^{-1}, \quad |\sigma| = |C| = M_0 L_0^{-3}, \quad |\theta| = |\psi| = L_0^2 T_0^{-2}.
\]
(23)

Here \( L_0, T_0, M_0 \) denote the SI dimensions of the length, time and mass units expressed in meters, seconds and kilograms respectively. A simple analysis of (23) shows that necessary condition for fulfillment of (23) is \( |\xi| = L_0^3 T_0^{-2} M_0^{-2} \) (see (Alekseev & Tereshko, 2008)).

Below we shall use some results concerning problem (5), (6) and extremum problem (21). The proofs of the theorems are similar to those in (Alekseev & Tereshko, 2008).
Theorem 1. Let conditions (i), (ii) be satisfied. Then for any \( u \in K \) problem (5), (6) has a weak solution \((u, p, \zeta) \in X\) that satisfies the estimates \( \|u\|_1 \leq M_u(u_0, u), \|p\| \leq M_p(u_0, u), \|\zeta\|_1 \leq M_C(u_0, u)\). Here \( M_u(u_0, u), M_p(u_0, u) \) and \( M_C(u_0, u) \) are nondecreasing continuous functions of the norms \( \|f\|_{-1}, \|b\|, \|f\|, \|k\|, \|\psi\|_{1/2, \Gamma_0}, \|g\|_{1/2, \Gamma}, \|x\|_{\Gamma_0} \). If the functions \( f, b, f, k, \psi, g, \chi \) are small (or the viscosity \( \nu \) is high) in the sense that

\[
\gamma_0 M_u(u_0, u) \frac{1}{\delta_0} + \frac{\beta_1 M_p(u_0, u)}{\delta_1} \lambda < 1, \tag{24}
\]

then the weak solution to problem 1 is unique. Here \( \delta_0, \delta_1, \gamma_0, \gamma_1, \beta_1 \) are the constants from (10)–(14).

Theorem 2. Under conditions (i), (ii), (j) let \( \lambda \) be a weakly lower semicontinuous functional and \( Z_{ad} \neq \emptyset \). Then control problem (21) has at least one solution.

Theorem 3. Under conditions (i), (ii), (j) let \( \mu_0 > 0, \mu_1 > 0 \) and \( K_1 \) be the bounded sets, \( I = 1, 2 \). Then control problem (21) has at least one solution for \( I = I_k, k = 1, 2, 3, 4 \).

Theorem 4. Under conditions (i), (ii), (j) let \( (\hat{x}, \hat{u}) \equiv (\hat{u}, \hat{p}, \hat{C}, \hat{g}, \hat{X}) \in X \times K \) be a local minimizer in problem (21) and let the functional \( I \) be continuously differentiable at the point \( \hat{x} \). Then, there exists a nonzero Lagrange multiplier \( (\lambda_0, y^*) = (\lambda_0, \zeta^*, \theta^*, \xi^*) \in R^1 \times H_0^1(\Omega) \times L^2_0(\Omega) \times \hat{H}^1(\Gamma) + \hat{H}^1(\Gamma) \times \hat{H}^1(\Gamma_0) \) that satisfies the Euler-Lagrange equation \( F_1^*(\hat{x}, \hat{u}) y^* = -\lambda_0 I_1^*(\hat{x}, \hat{u}) \), which is equivalent to the identities

\[
v_a(0, \omega, \bar{\xi}) + c(\bar{u}, \bar{C}, \omega, \bar{\xi}) + c(\omega, \bar{u}, \bar{\xi}) + \chi c_1(\bar{u}, \bar{C}, \omega) + b(w, \sigma) + (\bar{\xi}, \bar{\omega})_\Gamma = \]

\[
- \lambda_0(\mu_0/2)(\bar{I}_p^*(\hat{x}, \omega) \forall \omega \in \hat{H}^1(\Omega), \ b(\xi, r) \equiv - (\text{div} \xi, r) = - \lambda_0(\mu_0/2)(\bar{I}_p^*(\hat{x}, \omega) \forall r \in L^2(\Omega),
\]

\[
\chi(\alpha_1(\tau, \theta) + (k \tau, \theta) + c_1(\bar{u}, \bar{C}, \omega, \bar{\xi}) + (\bar{\xi}, \tau)_{\Gamma_0}) - b_1(\tau, \bar{\xi}) =
\]

\[
- \lambda_0(\mu_0/2)(\bar{I}_p^*(\hat{x}, \tau) \forall \tau \in \hat{H}^1(\Omega),
\]

and satisfies the minimum principle \( L(\hat{x}, \hat{u}, \lambda_0, y^*) \leq L(\hat{x}, u, \lambda_0, y^*) \) for all \( u \in K \) and the variational inequality

\[
\lambda_0(\mu_1/2)(\hat{g} - \hat{g})_{1/2, \Gamma} - (\xi, \bar{\xi} \hat{g} - \hat{g})_{\Gamma} + \lambda_0(\mu_2(\hat{x} - \hat{X})_{\Gamma_0} - \chi(\theta, \hat{X} - \hat{x})_{\Gamma_0}) \geq 0 \forall u = (g, \chi). \tag{27}
\]

Theorem 5. Let the assumptions of Theorem 4 be satisfied and inequality (24) hold for all \( u \in K \).

Then: 1) homogeneous problem (25), (26) if \( \lambda_0 = 0 \) has only trivial solution \( y^* = (\xi, \theta, \zeta, \theta, \xi^*) = 0 \); 2) any nontrivial Lagrange multiplier satisfying (25), (26) is regular, i.e., it has the form \( (1, y^*) \).

Relations (25), (26), together with variational inequality (27) and operator constraint (21) constitute an optimality system. It consists of three parts. The first part has the form of a weak formulation (17)–(19) of problem (5), (6), which is equivalent to operator equation (20). The second part consists of identities (25), (26) for the Lagrange multipliers \( \xi, \theta, \zeta, \theta \) and \( \xi^* \).

Finally, the last part of the optimality system is the variational inequality (27) with respect to controls \( g \) and \( \chi \) which is the consequence of the minimum principle.

Remark 1. We emphasize that the multiplier (adjoint velocity) \( \xi \) is in a general case a nonsolenoidal vector-function except the situation when the cost functional \( I \) independent of pressure \( p \). Only in this case it follows from (25) that \( \text{div} \xi = 0 \) and moreover \( \xi \in V \).
Remark 2. Denote by \( g_i = g|_{\Gamma_i} \) the restriction of the boundary vector \( g \) to the component \( \Gamma_i \) of \( \Gamma \) and introduce values \( q_i \) of the vector \( g_i \) through \( \Gamma_i \) by \( q_i = (g_i, n)_{\Gamma_i} \equiv \int_{\Gamma_i} g_i \cdot n \, d\sigma \). We note that the incompressibility condition \( \text{div} \, u = 0 \) in (5) results in the following necessary condition for \( q_i \):

\[
(g, n)_{\Gamma} = q_1 + q_2 + \ldots + q_N = 0.
\]

At the same time Theorem 1 is proved under more strict condition \( g \in H^{1/2}(\Gamma) \) on \( g \) equivalent to \( N \) conditions \( q_1 = 0, q_2 = 0, \ldots, q_N = 0 \) for the vector \( g \). The latter is connected with the fact that the proof of Theorem 1 is based on the generalization of the Hopf’s lemma (Hopf, 1941). According to this generalized Hopf’s lemma for any vector \( g \in H^{1/2}(\Gamma) \) and any \( \varepsilon > 0 \) there exists such a solenoidal expansion \( u_0 \in H^1(\Omega) \) into \( \Omega \) for which

\[
|((v \cdot \nabla)u_0, v)| \leq \varepsilon \|g\|_{1/2, \Gamma} \|v\|_{L}^2 \quad \forall v \in V.
\]

Using this lemma one can look for a weak solution of problem (5) at \( \beta_C = 0 \) in the form 
\( u = u_0 + \tilde{u} \), where \( \tilde{u} \in V \) is a new unknown function and to obtain a “coercitive” nonlinear operator equation for function \( \tilde{u} \). The existence of the solution \( \tilde{u} \) of the latter equation can be proved using Schauder theorem (see e.g. (Alekseev & Tereshko, 2008)). It should be noted that the question of Hopf’s lemma validity and proof of the existence theorem for problem (5) at \( \beta_C = 0 \) under fulfillment only condition \( (g, n)_{\Gamma} = 0 \) to the vector \( g \in H^{1/2}(\Gamma) \) is till open. One can read about this problem (so called Leray problem) in more details in (Alekseev & Tereshko, 2008, Appendix 5) and in (Pukhnachev, 2009; Joseph, 1976).

3. General property of the optimality system solutions

Let us consider control problem (21). Denote by \((x_1, u_1) \equiv (u_1, p_1, C_1, g_1, \chi_1) \in X \times K\) its solution. By \((x_2, u_2) \equiv (u_2, p_2, C_2, g_2, \chi_2) \in X \times K\) we denote a solution of problem

\[
\hat{f}(x, u) = \frac{H_0}{2} f(x) + \frac{H_1}{2} \|g\|_{H^{1/2, \Gamma}}^2 + \frac{H_2}{2} \|\chi\|_{H^1}^2 \rightarrow \inf \, F(x, u) = 0, \quad (x, u) \in X \times K,
\]

which is obtained from (21) by replacing a functional \( I \) in (21) with another one \( \hat{I} \). In view of Theorem 1 the following estimates for pairs \((u_i, p_i)\) hold

\[
\|u_i\|_1 \leq M_{u_i}^0 = \sup_{u \in K} M_u(u_0, u), \quad \|p_i\| \leq M_{p_i}^0 = \sup_{u \in K} M_p(u_0, u), \quad \|C_i\|_1 \leq M_{c_i}^0 = \sup_{u \in K} M_c(u_0, u).
\]

We introduce “model” Reynolds number \( \text{Re} \), Rayleigh number \( \text{Ra} \) and Prandtl number \( \text{Pr} \) by

\[
\text{Re} = \frac{\gamma_0 M_{u_0}^0}{\delta_0 v}, \quad \text{Ra} = \frac{\gamma_1 \beta_1 M_{c_1}^0}{\delta_1 \lambda}, \quad \text{Pr} = \frac{\delta_0 \nu}{\delta_1 \lambda}
\]

and assume that

\[
\text{Re} + \text{Ra} = \frac{\gamma_0 M_{u_0}^0}{\delta_0 v} + \frac{\gamma_1 \beta_1 M_{c_1}^0}{\delta_1 \lambda} < 1/2.
\]

www.intechopen.com
Denote by \((1,y_i^*)\equiv (1,\tilde{z}_i,\zeta_i,\theta_i,\xi_i^*),\ i=1,2,\) the Lagrange multipliers corresponding to the solutions \((u_i,u_i^*)\) (these multipliers are uniquely determined under condition (31)). By definition elements \((\xi_i^*,\zeta_i,\theta_i,\xi_i^*)\) satisfy relations
\[
v a_0(w,\xi_i^*) + c(u, w, \xi_i^*) + c(w, u_i^*, \xi_i^*) + \chi c_1(w, C_i, \theta_i) + b(w, \sigma_i) + (\xi_i^*, w) = 0 \quad \forall w \in \mathcal{H}^1(\Omega),
\]
\[
= -(\mu_0/2)\sqrt{(I^p_1(x_i))} w \quad \forall w \in \mathcal{H}^1(\Omega), \quad (\zeta_i, r) = -(\mu_0/2)\sqrt{(I^p_1(x_i))} r \forall r \in L^2_0(\Omega),
\]
(32)
\[
= -\mu_0/2\sqrt{(I^c_1(x_i))} \quad \forall r \in \mathcal{H}^1(\Omega).
\]
(33)

Here we renamed \(I = I^1, \quad I = I^2.\) Let \(g = g_1 - g_2, \quad \chi = \lambda_1 - \lambda_2.\)

Subtracting equations (17)–(19), written for \(u_2, p_2, C_2, u_2,\) from corresponding equations (17)–(19) for \(u_1, p_1, C_1, u_1\) gives
\[
v a_0(u, v) + c(u, u_1, v) + c(u_2, u, v) + b(v, p) - b_1(C, v) = 0 \quad \forall v \in \mathcal{H}^1(\Omega),
\]
(35)
\[
\lambda a_1(C, S) + \chi_1(u, C_1, S) + c_1(u_2, C, S) = (\chi_1 S)_{\mathcal{F}_N} \quad \forall S \in \mathcal{T},
\]
(36)
\[
\text{div } u = 0 \quad \Omega, \quad u|_{\Gamma_0} = g, \quad C|_{\Gamma_0} = 0.
\]
(37)

Setting \(g = g_1, \quad \chi = \chi_1\) in (27) under \(\lambda_0 = 1,\) written for \(g = g_2, \quad \chi = \chi_2, \quad \xi = \xi_2\) and setting \(g = g_2, \quad \chi = \chi_2\) in (27) written for \(g = g_1, \quad \chi = \chi_1, \quad \xi = \xi_1\) we obtain \(\mu_1 g_1 g_{1/2} + (\xi_2 \xi_2) r + \mu_2 (2\xi_2) r_N - \chi(\theta_2, \lambda) r_N \geq 0, \quad -\mu_1 g_1 g_{1/2} + (\xi_1 \xi_1) r - \mu_2 (\chi_1, \lambda) r_N + \chi(\theta_1, \lambda) r_N \geq 0.\) Adding up these inequalities yields the relation
\[-(\xi, g)_{\mathcal{F}_N} - \chi(\theta, \lambda) r_N \leq -\mu_1 g^2_{1/2, F} - \mu_2 |\chi|^2_{F, N}.
\]
(38)

Subtract equations (32), (33) written for \((x_2, u_2, y_2^*)\) from corresponding equations for \((x_1, u_1, y_1^*)\). We obtain
\[
v a_0(w, \xi_1) + c(u_1, w, \xi_1) + c(u, u_1, \xi_1) + c(w, u_1, \xi_1) + \chi c_1(w, C_1, \theta_1) + b(w, \sigma_1) + (\xi_1, w) = 0 \quad \forall w \in \mathcal{H}^1(\Omega),
\]
(39)
\[
= -(\mu_0/2)\sqrt{(I^p_1(x_1))} - I^p_1(x_1), \quad \forall r \in \mathcal{H}^1(\Omega),
\]
(40)
\[
\mu_0/2\sqrt{(I^p_1(x_1))} - I^p_1(x_1), \quad \forall r \in L^2_0(\Omega).
\]
(41)
Set $w = u, \tau = C, r = p$ in (39), (40), (41) and add up the results. Taking into account (37) we obtain

$$\nu a_0(u, \xi) + c(u_1, u, \xi) + 2c(u, u, \xi_2) + c(u, u_1, \xi) + \kappa c_1(u, C_1, \theta) + \kappa c_1(u, C, \theta_2) + (\xi, g)_{\Gamma} +$$

$$\kappa [\lambda a_1(C, \theta) + (kC, \theta) + c_1(u, C, \theta) + c_1(u, C, \theta_2)] -$$

$$b_1(C, \xi) + b_2(\xi, p) = -(\mu_0/2)(I_C^p(x_1) - I_C^0(x_2), u) - (\mu_0/2)(I_C^0(x_1) - I_C^0(x_2), C) -$$

$$- (\mu_0/2)(I_0^p(x_1) - I_0^p(x_2), p).$$

(42)

Set $v = \xi$ in (35), $S = x\theta$ in (36) and subtract the results from (42). Using (38) and identities

$$2c(u, u_2, \xi_2) + c(u_1, u, \xi) - c(u_2, u, \xi) = 2c(u, u, \xi_2) + c(u, u, \xi) = c(u, u, \xi_1 + \xi_2),$$

we obtain

$$c(u, u, \xi_1 + \xi_2) + \kappa c_1(u, C_1, \theta_1 + \theta_2) + (\mu_0/2)(I_C^p(x_1) - I_C^0(x_2), u) +$$

$$(\mu_0/2)(I_C^0(x_1) - I_C^0(x_2), C) + (\mu_0/2)(I_0^p(x_1) - I_0^p(x_2), p) \leq -\nu_1 \|g\|^2_{2, \Gamma} - \nu_2 \|\chi\|^2_{\Gamma}.$$

(43)

Thus the following result holds.

**Theorem 6.** Let under conditions of Theorem 4 for $I_1 = 1$ and $I_2 = \bar{I}$ pairs $(x_1, u_1) = (u_1, p_1, C_1, g_1, \chi_1) \in X \times K$ and $(x_2, u_2) = (u_2, p_2, C_2, g_2, \chi_2) \in X \times K$ are solutions to problems (21) and (28) respectively, $y_i = (\xi, \tau_i, \alpha_i, \beta_i, \delta_i, \gamma_i), i = 1, 2$, are the Lagrange multipliers corresponding to these solutions $(x_i, u_i)$. Then the relation (43) for differences $u = u_1 - u_2, p = p_1 - p_2, C = C_1 - C_2, g = g_1 - g_2, \chi = \chi_1 - \chi_2$ holds. Below we shall need some estimates of differences $u = u_1 - u_2$ and $p = p_1 - p_2$ via differences $C = C_1 - C_2$ and $g = g_1 - g_2$. In order to deduce them denote by $u_0 \in H^1(\Omega)$ a function such that $\text{div} u_0 = 0, \|u_0\|_{1, \Omega} = g$. Here a constant $c_0$ depends on $\Omega$. The existence of $u_0$ follows from (Girault & Raviart, 1986, p. 24). Set $u \equiv u_1 - u_2 = u_0 + \bar{u}$ where $\bar{u} \in V$ is a certain function. Set $u = u_0 + \bar{u}, v = \bar{u}$ in (35). Taking into account (8) we obtain

$$v a_0(u, \bar{u}) = -v a_0(u_0, \bar{u}) - c(u_0, u_1, \bar{u}) - c(\bar{u}, u_1, \bar{u}) - c(u_2, u_0, \bar{u}) + b_1(C, \bar{u}).$$

Using estimates (10), (12), (14), (29) and this relation we deduce, that

$$\delta_0u \bar{u} \leq v u_0 \|u_1 \| \bar{u} + \gamma_0 M_0^0 \|u\|^2 + 2\gamma_0 M_0^0 \|u_0\| \|\bar{u}\| + \beta_1 \|C\| \|\bar{u}\|_1.$$  

(44)

It follows from (31) that

$$(\delta_0 u / 2) \leq \delta_0 v - \gamma_0 M_0^0 - \beta_1 \gamma_1 M_0^0 \leq \delta_0 v - \gamma_0 M_0^0.$$  

(45)

Rewriting (44) in view of (45) as

$$\delta_0 v / 2 \leq (\delta_0 v - \gamma_0 M_0^0) \|\bar{u}\|_1 \leq (v + 2 \gamma_0 M_0^0) \|u_0\| \|\bar{u}\| + \beta_1 \|C\| \|\bar{u}\|_1.$$  

www.intechopen.com
we obtain that
\[
\| \tilde{u} \|_1 \leq \left( \frac{2}{\delta_0} \nu + 2\gamma_0 M_u^0 \right) \| u_0 \|_1 + (2\beta_1/\delta_0 \nu) \| C \|_1 \leq (2\delta_0^{-1} + 4\mathcal{R}e) \| u_0 \|_1 + (2\beta_1/\delta_0 \nu) \| C \|_1, \quad \mathcal{R} \equiv \delta_0^{-1} + 2\mathcal{R}e.
\]
Taking into account that \( u = u_0 + \tilde{u} \), we deduce the following estimate:
\[
\| u \|_1 \leq \| u_0 \|_1 + \| \tilde{u} \|_1 \leq c_0(2\mathcal{R} + 1) \| g \|_{1/2, \Gamma} + (2\beta_1/\delta_0 \nu) \| C \|_1.
\] (46)
Analogous estimate holds and for pressure difference \( p = p_1 - p_2 \). We make use inf-sup condition (16) for obtaining this estimate. By (16) for the function \( p = p_1 - p_2 \) and any (small) number \( \delta > 0 \) there exists a function \( v_0 \in H_0^1(\Omega) \), \( v_0 \neq 0 \) such that \( b(v_0, p) \geq \beta_0 \| v_0 \|_1 \| p \|_1 \), \( \beta_0 = (\beta - \delta) > 0 \). Setting \( v = v_0 \) in (35). Using this estimate and (10), (12), (14) we have
\[
\beta_0 \| v_0 \|_1 \| p \| \leq b(v_0, p) \leq (\nu + 2\gamma_0 M_u^0) \| v_0 \|_1 \| u \|_1 + \beta_1 \| C \|_1 \| v_0 \|_1.
\]
As \( \| v_0 \|_1 \neq 0 \) we deduce from this relation that
\[
\| p \| \leq \frac{\nu + 2\gamma_0 M_u^0}{\beta_0} \| u \|_1 + \frac{\beta_1}{\beta_0} \| C \|_1 = \frac{\delta_0 \nu}{\beta_0} c_0(2\mathcal{R} + 1) \| g \|_{1/2, \Gamma} + \frac{\beta_1}{\beta_0} (2\mathcal{R} + 1) \| C \|_1.
\] (47)
Using (46) we obtain the following estimate for \( \| p \| :\)
\[
\| p \| \leq \frac{\delta_0 \nu}{\beta_0} c_0(2\mathcal{R} + 1) \| g \|_{1/2, \Gamma} + \frac{\beta_1}{\beta_0} (2\mathcal{R} + 1) \| C \|_1.
\] (48)
Based on Theorem 6 and estimates (46)–(48) we establish in the next section sufficient conditions to input data which provide uniqueness and stability of the solution \((\tilde{x}, \tilde{u})\) to problem (21) for a number of concrete cost functionals and controls.

**Remark 3.** Let us note that if \( u = g \) (or \( u = \chi \)) then this boundary control problem can be considered as a particular case of the general boundary control problem (21) corresponding to situation when \( K_2 \) (or \( K_1 \)) is singleton: \( K_2 = \{ \chi \} \) (or \( K_1 = \{ g \} \)).

### 4. Uniqueness and stability of solutions of boundary control problems

In this section we firstly consider the problem (21) in the case where \( I = I_1 \) and \( u = g \in K_1 \), i.e. we consider one-parameter boundary control problem
\[
F(x, g) \equiv \frac{\mu_0}{2} \| v - v_d \|^2_Q + \frac{\mu_1}{2} \| g \|^2_{1/2, \Gamma} \to \inf, \quad F(x, g) = 0, \quad x = (v, q, S) \in X, \ g \in K_1.
\] (49)
Let \((x_1, u_1) \equiv (u_1, p_1, C_1, g_1) \) be a solution to problem (49) which corresponds to a function \( v_d \equiv u_d^{(1)} \in L^2(Q) \), \((x_2, u_2) \equiv (u_2, p_2, C_2, g_2) \) be a solution to problem (49) which corresponds to another function \( v_d \equiv u_d^{(2)} \in L^2(Q) \). Setting \( g = g_1 - g_2, \ u_d = u_d^{(1)} - u_d^{(2)} \) in addition to (34), we note that
\[
\langle (I_1)'_u(x_1), w \rangle_Q = 2(u_1 - u_d, w)_Q, \quad \langle (I_1)'_u(x_1) - (I_1)'_u(x_2), u \rangle_Q = 2(u - u_d, u)_Q =
\]
\[
2(\| u \|^2_Q - (u, u_d)_Q), \quad (I_1)'_C = 0.
\] (50)
The relations (35), (37) for problem (49) do not change while identities (36), (32), (33) and the main inequality (43) take by (50) and remark 1 a form

\[ \lambda a_1(C, S) + (kC, S) + c_1(u, C, S) + c_1(u_2, C, S) = 0 \quad \forall S \in T, \] (51)

\[ v_0(w, \xi_i) + c(u, w, \xi_i) + c(w, u, \xi_i) + \gamma \sigma_1(w_i, C_i, \theta_i) + b(w, c_i) + (\xi_i, w) = \] (52)

\[ \frac{\mu_0(u_i - u_d^{(i)}), w)_{Q} \forall w \in H^1(\Omega), \xi_i \in V, i = 1, 2, \]

\[ \gamma \sigma_1(\tau, \theta_i) + c(u, \tau, \theta_i) + c(w, \xi, \tau_i)_{Q} = 0 \quad \forall \tau \in H^1(\Omega), \]

\[ c(u, u, \xi_1 + \xi_2) + \gamma \sigma_1(u, C_i, \theta_1 + \theta_2) + \mu_0(||u||^2_{Q} - (u, u)_{Q}) \leq -\mu_1 ||g||^2_{1/2, \Gamma}. \]

(54)

It follows from (37) that \( C \in T \). Set \( S = C \) in (51). Using (9) we obtain that

\[ \lambda a_1(C, C) + (kC, C) = -c_1(u, C, C). \] (55)

It follows from (13), (14), (29) that

\[ |c_1(u, C, C)| \leq \gamma_1 M_{c_1}^0 ||u||_1 ||C||_1, \quad |b_1(C, u)| \leq \beta_1 ||u||_1 ||C||_1. \] (56)

Taking into account (11), (56), we obtain from (55) that \( \delta_1 \lambda ||C||^2 \leq \gamma_1 M_{c_1}^0 ||u||_1 ||C||_1. \) From this inequality we deduce the following estimate for \( ||C||_1 \):

\[ ||C||_1 \leq \frac{\gamma_1 M_{c_1}^0}{\delta_1 \lambda} ||u||_1. \] (57)

Using (46), (57) and (30) we have

\[ ||u||_1 \leq c_0(2R + 1) ||g||_{1/2, \Gamma} + \frac{2\beta_1 \gamma_1 M_{c_1}^0}{\delta_1 \lambda} ||u||_1 = c_0(2R + 1) ||g||_{1/2, \Gamma} + 2Ra \frac{||u||_1}{1}. \] (58)

It follows from (58) and (30) that \( (1 - 2Ra) ||u||_1 \leq c_0(2R + 1) ||g||_{1/2, \Gamma} \). Taking into account that \( 2Ra < 1 \) by (31) we obtain from this estimate, (57) and (48) that

\[ ||u||_1 \leq c_0(2R + 1) \frac{||g||_{1/2, \Gamma}}{1 - 2Ra} \quad (59) \]

\[ ||C||_1 \leq \frac{c_0(2R + 1) \gamma_1 M_{c_1}^0}{(1 - 2Ra) \delta_1 \lambda} ||g||_{1/2, \Gamma}, \quad p \leq \frac{2\beta_0 ||u||_{1, \Gamma}^2}{(1 - 2Ra) \beta_0 ||g||_{1/2, \Gamma}} \quad (60) \]

Set \( w = \xi_i, \tau = \theta_i \) in (52), (53). Using (8), (9) and conditions \( \xi_i \in V, \theta_i \in T \) we deduce that

\[ v_0(\xi_i, \tau_i) = -c(\xi_i, u_i, \xi_i) + \sigma_1(\xi_i, C_i, \theta_i) - \mu_0(u_i - u_d^{(i)} \xi_i)_{Q}. \] (61)

\[ \sigma_1(\tau_i, \theta_i) + (k\theta_i, \theta_i) = b_1(\theta_i, \xi_i), \quad i = 1, 2. \] (62)

It follows from (10)–(14), (7), (29) that

\[ a_0(\xi_i, \tau_i) \geq \delta_0 ||\xi_i||_{T}^2 |c(\xi_i, u_i, \xi_i)| \leq \gamma_0 ||u_i||_1 ||\xi_i||_{T}^2 \leq \gamma_0 M_{u}^0 ||\xi_i||_{T}^2, \] (63)
where 
\[
\|\theta_1\| \leq \frac{\beta_1}{\delta_1} \|\xi_i\|, \quad \|\theta_2\| \leq \frac{\beta_1}{\delta_1} \|\xi_i\|.
\]
Combining these inequalities with (45) and (30) gives
\[
\|\xi_i\| \leq \frac{2\mu_0\gamma_3}{\gamma_0} (Re + Re^0), \quad \|\theta_i\| \leq \frac{\beta_1}{\delta_1} \frac{2\mu_0\gamma_3}{\gamma_0} (Re + Re^0),
\]
where
\[
\gamma_3 = c_Q, \quad Re^0 = \frac{\gamma_0}{\delta_0} \max(\|u_j^{(1)}\|_Q, \|u_d^{(2)}\|_Q).
\]
Taking into account (12), (13), (57), (60), and (30) we have
\[
|c(u, u, \xi_1 + \xi_2)| \leq \gamma_0 \|u\|^2 \|\xi_i\|_1 + \|\xi_2\|_1 \leq 4\mu_0\gamma_3 (Re + Re^0) \|u\|^2,
\]
\[
x c_1(u, C, \theta_1 + \theta_2) \leq x c_1 \|u\|_1 \|C\|_1 (\|\theta_1\|_1 + \|\theta_2\|_1) \leq \frac{\gamma_1 M_1^0 \gamma_1 \beta_1}{\delta_1} \frac{4\mu_0\gamma_3 (Re + Re^0)}{\gamma_0} \frac{\gamma_1}{\gamma_0} \|R\| \|\xi_i\|_1 \|u\|^2
\]
which yields
\[
|c(u, u, \xi_1 + \xi_2) + x c_1(u, C, \theta_1 + \theta_2)| \leq 4\mu_0\gamma_3 (Re + Re^0) [1 + (\gamma_1 / \gamma_0) \|R\|] \|u\|^2.
\]
Using (59) we deduce from (68) that
\[
|c(u, u, \xi_1 + \xi_2)| \leq 4\mu_0\gamma_3 \|g\|^2 (Re + 1)^2 (Re + Re^0) [1 + (\gamma_1 / \gamma_0) \|R\|] \|u\|^2.
\]
Let input data for problem (49) and parameters \(\mu_0, \mu_1\) be such that
\[
(1 - \epsilon)\mu_1 \geq \frac{4\mu_0\gamma_3 \|g\|^2 (Re + 1)^2 (Re + Re^0) [1 + (\gamma_1 / \gamma_0) \|R\|]}{(1 - 2\|R\|)^2}, \quad \epsilon = \text{const} > 0.
\]
Here and further \(\epsilon > 0\) is a (small) constant. In view of (70) we find from (69) that
\[
|c(u, u, \xi_1 + \xi_2) + x c_1(u, C, \theta_1 + \theta_2)| \leq (1 - \epsilon)\mu_1 \|g\|^2 (Re + 1)^2 (Re + Re^0).
\]
Taking into account (71) we come from (54) to the inequality
\[
\mu_0 (\|u\|^2_Q - (u, u_d)_Q) \leq -c(u, u, \xi_1 + \xi_2) - x c_1(u, C, \theta_1 + \theta_2) - \mu_1 \|g\|^2 (Re + 1)^2 (Re + Re^0) \leq -\epsilon\mu_1 \|g\|^2 (Re + 1)^2 (Re + Re^0).
\]
It follows from (72) that \( \| \mathbf{u} \|_{Q}^{2} \leq (\mathbf{u}, \mathbf{u})_{Q} \leq \| \mathbf{u} \|_{Q} \| \mathbf{u} \|_{Q} \), which yields \( \| \mathbf{u} \|_{Q} \leq \| \mathbf{u}_{d} \|_{Q} \). As \( \mathbf{u} = \mathbf{u}_{1} - \mathbf{u}_{2}, \mathbf{u}_{d} = \mathbf{u}_{d}^{(1)} - \mathbf{u}_{d}^{(2)} \) we deduce the following estimate:

\[
\| \mathbf{u}_{1} - \mathbf{u}_{2} \|_{Q} \leq \| \mathbf{u}_{d}^{(1)} - \mathbf{u}_{d}^{(2)} \|_{Q} \tag{73}
\]

The estimate (73) in the case where \( Q = \Omega \) has the sense of the stability estimate of the component \( \mathbf{u} \) of the solution \((\hat{\mathbf{u}}, \hat{\mathbf{r}}_{C}, \hat{\mathbf{g}}_{d})\) to problem (49) with respect to small disturbances in the \( L^{2}(\Omega) \)-norm of the function \( \mathbf{v}_{d} \in L^{2}(\Omega) \) which enters into the expression for the functional \( I_{1} \) in (22). In the case where \( \mathbf{u}_{d}^{(1)} = \mathbf{u}_{d}^{(2)} \) it follows from (73) that \( \mathbf{u}_{1} = \mathbf{u}_{2} \). This yields together with (57), (47) and condition \( \mathbf{u}_{d}^{i} = \mathbf{g} \equiv \mathbf{g}_{1} - \mathbf{g}_{2} \) in (35) that \( C_{1} = C_{2}, p_{1} = p_{2} \) and \( g_{1} = g_{2} \). The latter means the uniqueness of the solution to problem (49) when \( Q = \Omega \) and (70) holds.

We note that the uniqueness and stability of the solution to problem (49) under condition (70) take place and in the case where \( Q \subset \Omega \), i.e. \( Q \) is a part of \( \Omega \). In order to prove this fact let us consider the inequality (72). Using (73) rewrite it in the form

\[
\varepsilon \mu_{1} \| \mathbf{g} \|_{L^{2}(\Omega)}^{2} \leq c(\mathbf{u}, \mathbf{u}, \mathbf{c}_{1} + \varepsilon_{2}^{2}) + \varepsilon c_{1}(\mathbf{u}, \mathbf{C}, \theta_{1} + \theta_{2}) + \mu_{1} \| \mathbf{g} \|_{L^{2}(\Omega)}^{2} \leq - \mu_{0} \| \mathbf{u} \|_{Q}^{2} + \mu_{0} \| \mathbf{u} \|_{Q} \| \mathbf{u}_{d} \|_{Q} \leq \mu_{0} \| \mathbf{u} \|_{Q}^{2}. \]

From this relation, (59) and (60) we deduce the following stability estimates:

\[
\| \mathbf{g}_{1} - \mathbf{g}_{2} \|_{L^{2}(\Omega)} \leq \sqrt{\frac{\mu_{0}}{\varepsilon \mu_{1}}} \| \mathbf{u}_{d}^{(1)} - \mathbf{u}_{d}^{(2)} \|_{H^{0}(\Omega)}, \quad \| \mathbf{u}_{1} - \mathbf{u}_{2} \|_{L^{2}(\Omega)} \leq \frac{c_{0}(2R + 1)}{1 - 2Ra} \sqrt{\frac{\mu_{0}}{\varepsilon \mu_{1}}} \| \mathbf{u}_{d}^{(1)} - \mathbf{u}_{d}^{(2)} \|_{H^{0}(\Omega)},
\]

\[
\| p_{1} - p_{2} \| \leq \frac{\delta \varepsilon \mu_{0} c_{0}(2R + 1)(R + Ra)}{\rho_{0}(1 - 2Ra)} \sqrt{\frac{\mu_{0}}{\varepsilon \mu_{1}}} \| \mathbf{u}_{d}^{(1)} - \mathbf{u}_{d}^{(2)} \|_{H^{0}(\Omega)}, \quad (\mathcal{R} \equiv \delta_{0}^{-1} + 2Re) \tag{74}
\]

where \( s = 0 \). Thus we have proved the following theorem.

**Theorem 7.** Let under conditions (i), (ii), (j) and (31) the quadruple \((\mathbf{u}_{i}, p_{i}, C_{i}, \mathbf{g})\) be the solution to problem (49) corresponding to a given function \( \mathbf{u}_{d}^{(i)} \in L^{2}(\Omega), i = 1, 2 \), and the condition (70) holds where \( \gamma_{s} \) and \( Re^{s} \) are defined in (67). Then stability estimates (73) and (74) under \( s = 0 \) hold true.

We emphasize that the uniqueness and stability of the solution to problem (49) both under \( Q = \Omega \) and under \( Q \subset \Omega \) is proved only if parameter \( \mu_{1} \) in (49) is positive and satisfies (70). This means that term \( (\mu_{1}/2) \| \mathbf{g} \|_{L^{2}(\Omega)}^{2} \) in the expression for the minimized functional \( f \) in (49) has a regularizing effect on control problem (49).

In the same manner one can study uniqueness and stability of solutions to boundary control problems for another cost functionals depending on the velocity \( \mathbf{u} \). Let us consider for example the control problem

\[
\mathcal{J}(x, \mathbf{g}) \equiv \frac{\mu_{0}}{2} \| \mathbf{v} - \mathbf{v}_{d} \|_{L^{2}(\Omega)}^{2} + \frac{\mu_{1}}{2} \| \mathbf{g} \|_{L^{2}(\Omega)}^{2} \rightarrow \inf, \quad F(x, \mathbf{g}) = 0, \quad x = (\mathbf{v}, \varrho, S) \in X, \quad \mathbf{g} \in K_{1},
\]

which corresponds to the cost functional \( I_{2} = \| \mathbf{v} - \mathbf{v}_{d} \|_{L^{2}(\Omega)}^{2} \). Denoting by \((x_{i}, u_{i}) \equiv (\mathbf{u}_{i}, p_{i}, C_{i}, \mathbf{g})\) the solution to problem (75) corresponding to a function \( \mathbf{v}_{d} \equiv \mathbf{u}_{d}^{(i)} \in H^{1}(\Omega), i = 1, 2 \), and setting \( \mathbf{g} = \mathbf{g}_{1} - \mathbf{g}_{2}, \mathbf{u}_{d} = \mathbf{u}_{d}^{(1)} - \mathbf{u}_{d}^{(2)} \) in addition to (34) we note that

\[
\langle (I_{2})^{*}_{u}(x_{1}), \mathbf{w} \rangle = 2(\mathbf{u}_{i} - \mathbf{u}_{d}^{(i)}, \mathbf{w})_{1, \Omega} - \langle (I_{2})^{*}_{u}(x_{2}), \mathbf{w} \rangle_{1, \Omega} \Rightarrow \langle (I_{2})^{*}_{u}(x_{1}) - (I_{2})^{*}_{u}(x_{2}), \mathbf{w} \rangle = 2(\mathbf{u}_{d}, \mathbf{u})_{1, \Omega}
\]
\begin{equation}
\gamma_3 = 1, \quad \mathcal{R}^0 = (\gamma_0/\delta) \max(||u||_{1,Q}, ||u||_{1,\Omega}).
\end{equation}

Let us assume that condition (70) takes place where \( \gamma_3 \) and \( \mathcal{R}^0 \) are defined in (79). Using (70) we deduce (71). Taking into account (71) we obtain from (77) that
\begin{equation}
\mu_0(||u||^2_{1,Q} - (u,u_d)_{1,Q}) \leq -c_1(u,C,\theta_1 + \theta_2) - \mu_1 ||u||^2_{1,\Omega} \leq -\epsilon_1 ||u||^2_{1,\Omega}.
\end{equation}

It follows from (80) that \( ||u||^2_{1,\Omega} \leq (u,u_d)_{1,Q} \) which yields \( ||u||_{1,Q} \leq ||u||_{1,\Omega} \) or
\begin{equation}
||u_1 - u_2||_{1,Q} \leq ||u^{(1)}_d - u^{(2)}_d||_{1,Q}.
\end{equation}

In the case where \( Q = \Omega \) we deduce from (81), relation \( u|_\Gamma = g = g_1 - g_2 \), (7), (57) and (47) the following estimates:
\begin{equation}
||u_1 - u_2||_{1,\Omega} \leq ||u^{(1)}_d - u^{(2)}_d||_{1,\Omega}, \quad ||g_1 - g_2||_{1,\Omega} \leq 2M_0^{1/2} ||u^{(1)}_d - u^{(2)}_d||_{1,\Omega}.
\end{equation}

The estimates (82) have the sense of stability estimates for the solution \( (u, \beta, C, g) \) to problem (75) under \( Q = \Omega \) with respect to small disturbances in \( H^1(\Omega) \)-norm of the function \( v_1 \) which enters into the expression for the functional \( I_2 \). In the case where \( u^{(1)}_d = u^{(2)}_d \) we deduce from (82) that \( u_1 = u_2, g_1 = g_2, C_1 = C_2, p_1 = p_2 \) which means the uniqueness of solution to control problem (75) under \( Q = \Omega \). If \( Q \subset \Omega \) the estimates (82) do not hold true but using (80) one can obtain more rough estimates of kind (74) instead of them. In fact rewriting (80) in view of (81) in the form
\begin{equation}
\epsilon_1 ||u||^2_{1,\Omega} \leq -\mu_0 ||u||_{1,Q}^2 + \mu_0 ||u||_{1,Q} ||u||_{1,\Omega} \leq \mu_0 ||u||_{1,\Omega}^2
\end{equation}

and using (59), (60) we come to to the estimates (74) under \( s = 1 \). Thus we have proved the following result.

**Theorem 8.** Let under conditions (i), (ii), (j) and (31) the quadruple \( (u_0, p_1, C_0, g_0) \) be a solution to problem (75) corresponding to a given function \( u^{(i)}_d \in H^1(Q), i = 1, 2, \) and the condition (70) holds
where $\gamma_3$ and $Re^0$ are defined in (79). Then stability estimates (81) and (74) under $s = 1$ hold true. Furthermore estimates (82) hold if $Q = \Omega$.

We again note that the uniqueness and stability of the solution to problem (75) both under $Q = \Omega$ and under $Q \subset \Omega$ is proved above under condition that the parameter $\mu_1$ in (75) satisfies (70). We can not prove the stability of the solution to problem (75) as well as to problem (49) in the case where $\mu_1 = 0$. But we can establish the local uniqueness of the solution to problem (75) under $\mu_1 = 0$ in the case where $Q = \Omega$. In fact setting $\mu_1 = 0$, $Q = \Omega$, $u_d^{(1)} = u_d^{(2)}$ in (77) we obtain the inequality

$$c(u, u, \zeta_1 + \zeta_2) + xc_1(u, C, \theta_1 + \theta_2) \leq -\mu_0\|u\|_1. \quad (83)$$

Let input data for problem (75) be such that

$$4(Re + Re^0)[1 + (\gamma_1/\gamma_0)P\mathcal{R}a] < 1. \quad (84)$$

It follows from (68) under $\gamma_3 = 1$ and (83) that $u = 0$, and from (57), (47) and relation $u|_{F} = g$ we deduce that $C_1 = C_2$, $p_1 = p_2$, $g_1 = g_2$. So the next theorem holds.

**Theorem 9.** Let under conditions (i), (ii), (j) and (31) $\mathbf{v}_d \in H^1(\Omega)$ be a given function, $\mu_0 > 0$, $\mu_1 \geq 0$ and the condition (84) takes place where $\mathcal{R}e^0 = (\gamma_0/\delta_0)\|\mathbf{v}_d\|_1$. Then the solution $(\hat{u}, \hat{p}, \hat{C}, \hat{g})$ to problem (75) under $Q = \Omega$ is unique.

Let us consider the one-parameter control problem

$$J(x, g) \equiv \frac{\mu_0}{2} \|\text{rot} \mathbf{v} - \eta_d\|_Q^2 + \frac{\mu_1}{2} \|\mathbf{g}\|_{1/2, \Gamma} \rightarrow \inf F(x, g) = 0, x = (\mathbf{v}, g, S) \in X, g \in K_1, \quad (85)$$

corresponding to the cost functional $I_3(v) = \|\text{rot} \mathbf{v} - \eta_d\|_Q^2$. Denoting by $(x_i, u_i) = (u_i, p_i, C_i, g_i)$, $i = 1, 2$, the solution to problem (85) corresponding to the function $\eta_d = \zeta_d^{(i)} \in L^2(\Omega)$, $i = 1, 2$, and setting $g = g_1 - g_2$, $\zeta_d = \zeta_d^{(1)} - \zeta_d^{(2)}$ in addition to (34) we note that

$$\langle (I_3)'_{u}(x_i), w \rangle = 2(\text{rot} u_i - \zeta_d^{(i)}, \text{rot} w)_Q, \langle (I_3)'_{\eta}(x_i) - (I_3)'_{\eta}(x_2), u \rangle =$$

$$2(\text{rot} u - \zeta_d, \text{rot} u)_Q, \quad (I_3)'_{\zeta_d} = 0. \quad (86)$$

In view of (86) relations (35), (37), (51), (53), (62) and estimates (57), (59), (60) do not change while (43) and (32) under $w = \zeta_d$ transform to

$$c(u, u, \zeta_1 + \zeta_2) + xc_1(u, C, \theta_1 + \theta_2) + \mu_0(\|\text{rot} u\|_Q^2 - (\zeta_d, \text{rot} u)_Q) \leq -\mu_1\|\mathbf{g}\|_{1/2, \Gamma}. \quad (87)$$

$$\nu_0(\zeta_0, \zeta) = -c(\zeta, u, \zeta) + xc_1(\zeta, C, \theta) - \mu_0(\text{rot} u_i - \zeta_d^{(i)}, \text{rot} \zeta)_Q, \quad \zeta_i \in V. \quad (88)$$

Using (7) and (29) we have

$$|\langle \text{rot} u_i - \zeta_d^{(i)}, \text{rot} \zeta_d \rangle_Q| \leq (\|\text{rot} u_i\|_Q + \|\zeta_d^{(i)}\|_Q)\|\text{rot} \zeta_d\|_Q \leq c_\tau(M_u^0 + \|\zeta_d^{(i)}\|_Q)\|\zeta_d\|_1. \quad (89)$$

Taking into account (63), (64), (89) we deduce from (88) and (62) that

$$\|\theta_1\|_1 \leq \frac{\mu_0}{\delta_1 \lambda_1} \|\zeta_d^{(i)}\|_1, \quad (\delta_0 \nu - \gamma_0 M_u^0)\|\zeta_d^{(i)}\|_1 \leq \mu_0 c_\tau M_u^0 + \|\zeta_d^{(i)}\|_Q\|\zeta_d\|_1. \quad (90)$$
In view of (45) we obtain from this inequality that 
\[ \| \xi^{(i)} \|_1 \leq (2\mu_0/\delta_0\nu)\gamma_7^2(M_\mu + c_\gamma^{-1}\| \xi^{(1)}_d \|_Q) \]
which yields (66), (68) and (69) where
\[ \gamma_3 = c_\gamma^2, \quad R_\delta^0 = \frac{\gamma_0}{\delta_0^2\nu} \max(\| \xi^{(1)}_d \|_Q, \| \xi^{(2)}_d \|_Q). \]  
\[ (90) \]

Let us assume that the condition (70) takes place where \( \gamma_3 \) and \( R_\delta^0 \) are defined in (90). Using (70) we deduce (71). Taking into account (71) we obtain from (87) that
\[ \mu_0(\| \text{rot} \mathbf{u} \|_Q^2 - (\text{rot} \mathbf{u}, \xi_d)_{\Omega}) \leq -\epsilon_{\mu_1} \| \mathbf{g} \|_{1/2,\Gamma}. \]
\[ (91) \]
It follows from (91) that \( \| \text{rot} \mathbf{u} \|_Q^2 \leq (\text{rot} \mathbf{u}, \xi_d)_{\Omega} \) which yields \( \| \text{rot} \mathbf{u} \|_Q \leq \| \xi_d \|_Q \) or
\[ \| \text{rot} \mathbf{u}_1 - \text{rot} \mathbf{u}_2 \|_Q \leq \| \xi^{(1)}_d - \xi^{(2)}_d \|_Q. \]
\[ (92) \]
Rewriting (91) by (92) in the form \( \epsilon_{\mu_1} \| \mathbf{g} \|_{1/2,\Gamma}^2 \leq \mu_0 \| \xi_d \|_Q^2 \) and using (59), (60) we obtain the following stability estimates:
\[ \| \mathbf{g}_1 - \mathbf{g}_2 \|_{1/2,\Gamma} \leq \sqrt{\frac{\mu_0}{\epsilon_{\mu_1}}} \| \xi^{(1)}_d - \xi^{(2)}_d \|_Q, \| \mathbf{u}_1 - \mathbf{u}_2 \|_1 \leq \frac{c_\delta(2R + 1)}{1 - 2R\alpha} \sqrt{\frac{\mu_0}{\epsilon_{\mu_1}}} \| \xi^{(1)}_d - \xi^{(2)}_d \|_Q, \]
\[ \| \mathbf{C}_1 - \mathbf{C}_2 \|_1 \leq \frac{\gamma_1 M_\mu c_\delta(2R + 1)}{\gamma_0(1 - 2R\alpha)} \sqrt{\frac{\mu_0}{\epsilon_{\mu_1}}} \| \xi^{(1)}_d - \xi^{(2)}_d \|_Q, \]
\[ \| p_1 - p_2 \| \leq \frac{\delta_0 \nu \zeta_0(2R + 1)(R + \alpha)}{\beta_0(1 - 2R\alpha)} \sqrt{\frac{\mu_0}{\epsilon_{\mu_1}}} \| \xi^{(1)}_d - \xi^{(2)}_d \|_Q. \]
\[ (93) \]
Thus we have proved the following theorem.

**Theorem 10.** Let under conditions (i), (ii), (j) and (31) the quadruple \( \{ \mathbf{u}_i, \eta_i, \mathbf{C}_i, \mathbf{g}_i \} \) be a solution to problem (85) corresponding to a given function \( \xi^{(i)}_d \in L^2(\Omega), i = 1, 2, \) and condition (70) holds where \( \gamma_3 \) and \( R_\delta^0 \) are defined in (90). Then stability estimates (92) and (93) hold true.

We can not prove the stability of the solution to problem (85) in the case where \( \mu_1 = 0 \). But we can establish the local uniqueness of the solution to problem (85) under more strict conditions on \( \Omega \) and boundary vector \( \mathbf{g} \) if we replace condition (j) by the next condition:

(j') \( \Omega \) is a simply connected domain with the boundary \( \Gamma \subset C^1, K_1 \subset H^{1/2}(\Gamma) \) is a convex closed set consisting of functions \( \mathbf{g} \) which satisfy the condition \( \mathbf{g} \cdot \mathbf{n}_1 = q \) where \( q \in H^{1/2}(\Gamma) \) is a given function.

Indeed, let us note that (87) takes under \( \mu_1 = 0, \xi^{(1)}_d = \xi^{(2)}_d, Q = \Omega \) a form
\[ c(\mathbf{u}, \xi_1 + \xi_2 + \nu c(\mathbf{u}, \theta_1 + \theta_2)) = -\mu_0 \| \text{rot} \mathbf{u} \|_Q^2. \]
\[ (94) \]
Under the first condition in (j') the difference \( \mathbf{g} = \mathbf{g}_1 - \mathbf{g}_2 \) has the zero normal component on \( \Gamma \). Therefore taking into account the simple connectedness of the domain \( \Omega \) we have the estimate
\[ \| \mathbf{u}_1 \|_1 \leq c_\gamma \| \text{rot} \mathbf{u} \|_Q \]
with the constant \( c_\gamma \) depending on \( \Gamma \) (Girault & Raviart, 1986). Using this estimate we deduce from (68) where \( \gamma_3 \) and \( R_\delta^0 \) are given in (90) that
\[ |c(\mathbf{u}, \xi_1 + \xi_2) + \nu c(\mathbf{u}, \theta_1 + \theta_2)| \leq 4\mu_0 c_\gamma^2(\nu R^2 + R^2)|1 + (\gamma_1/\gamma_0)^P R| \nu \| \text{rot} \mathbf{u} \|_Q^2. \]
\[ (95) \]
Let input data for problem (85) be such that
\[ 4c_\gamma^2(\nu R^2 + R^2)|1 + (\gamma_1/\gamma_0)^P R| < 1. \]
\[ (96) \]
It follows from (94) and (95) that \( \text{rot} \, \mathbf{u} = 0 \) which yields \( \mathbf{u} = 0 \) or \( \mathbf{u}_1 = \mathbf{u}_2 \). From (57), (47) and the condition \( \mathbf{u}^\dagger = \mathbf{g} \) we deduce that \( C_1 = C_2, \, p_1 = p_2, \, \mathbf{g}_1 = \mathbf{g}_2 \). Thus we have proved the following theorem.

**Theorem 11.** Let under conditions (i), (ii), (f) and (31) \( \eta_d \in L^2(\Omega) \) be a given function, \( \mu_0 > 0, \mu_1 \geq 0 \) and the condition (96) takes place where \( R^d = (\gamma_0 / \delta_0 \nu C_\nu) \| \eta_d \| \). Then the solution \( (\hat{u}, \hat{p}, \hat{C}, \hat{g}) \) to problem (85) under \( Q = \Omega \) is unique.

In conclusion we consider two-parameter control problem corresponding to the cost functional \( I_1 \), i.e. we consider the control problem

\[
J(x, u) \equiv \frac{\mu_0}{2} \| v - v_d \|_Q^2 + \frac{\mu_1}{2} \| g \|_{L^2_{1/2} \Gamma}^2 + \frac{\mu_2}{2} \| \chi \|_{L^2_{1/2} \Gamma}^2 + \inf \, F(x, u) = 0,
\]

where \( x = (v, q, S) \in X, \, u = (g, \chi) \in K_1 \times K_2. \) (97)

Let \( (x_1, u_1) \equiv (u_1, p_1, C_1, g_1, \chi_1) \) be a solution to problem (97) which corresponds to a function \( v_d \equiv u_1^{(1)} \in L^2(Q), \, (x_2, u_2) \equiv (u_2, p_2, C_2, g_2, \chi_2) \) be a solution to problem (97) which corresponds to another function \( \hat{v}_d \equiv u_2^{(2)} \in L^2(Q). \) Setting \( g = g_1 - g_2, \, u_d = u_1^{(1)} - u_2^{(2)} \) in addition to (34), we note that the relations (50) hold true for problem (97). In view of (50) relations (52), (53), (61), (62) and estimates (66), (67) do not change while (43) takes the form

\[
c(u, u, \xi_1 + \xi_2) \rightarrow c_1(u, C, \eta_1 + \eta_2) + \mu_0(\| u \|^2_Q - (u, u_d)_Q) \leq -\mu_1 \| g \|^2_{L^2_{1/2} \Gamma} - \mu_2 \| \chi \|^2_{L^2_{1/2} \Gamma}. \tag{98}
\]

Moreover instead of (51) we have to use the original identity (36). It follows from (37) that \( C \in T \). Setting \( S = C \) in (36) and using (9) we obtain that

\[
\lambda_1 \xi_1(C, C) + (kC, C) = -c_1(u, C_1, C) + (\chi, C)_{\Gamma_1}. \tag{99}
\]

Using (11), (15) and the first estimate in (56) we deduce from (99) that \( \delta_1 \lambda \| C \|^2 \leq \gamma_1 C_1 \| u \|_1 + \gamma_2 \| \chi \|_{\Gamma_1} \| C \|_1. \) This yields the following estimate for \( \| C \|^1_1 \):

\[
\| C \|^1_1 \leq \frac{\gamma_1 C_1}{\delta_1 \lambda} \| u \|^1_1 + \frac{\gamma_2}{\delta_1 \lambda} \| \chi \|_{\Gamma_1}. \tag{100}
\]

Taking into account (46) we obtain from (100) that

\[
\| C \|^1_1 \leq \frac{2 \beta_1}{\delta_0 \nu} \gamma_1 C_1 \| u \|^1_1 + c_0 (2R + 1) \frac{\gamma_1 C_1}{\delta_1 \lambda} \| g \|_{L^2_{1/2} \Gamma} + \frac{\gamma_2}{\delta_1 \lambda} \| \chi \|_{\Gamma_1}. \tag{101}
\]

Using (30) and (46), (47) we deduce the following estimates for \( C, \, u \) and \( p \):

\[
\| C \|_1 \leq \frac{c_0 (2R + 1)}{(1 - 2Ra)} \frac{\gamma_1 C_1}{\delta_1 \lambda} \| g \|^1_{L^2_{1/2} \Gamma} \| \chi \|_{\Gamma_1} + \frac{\gamma_2}{\delta_1 \lambda} \| \chi \|_{\Gamma_1},
\]

\[
\| u \|_1 \leq \frac{c_0 (2R + 1)}{1 - 2Ra} \| g \|^1_{L^2_{1/2} \Gamma} + \frac{\gamma_2}{\delta_0 \nu (1 - 2Ra)},
\]

\[
\| p \| \leq \frac{\delta_0 \nu c_0 (2R + 1)(R + Ra)}{\beta_0 (1 - 2Ra)} \| g \|^1_{L^2_{1/2} \Gamma} + \frac{\beta_1 (2R + 1)}{\beta_0 (1 - 2Ra)} \| \chi \|_{\Gamma_1}. \tag{102}
\]
It follows from (12), (13), (66) and (102) that
\[
|c(u, u, \xi_1 + \xi_2)| \leq \gamma_0 \|u\|_1^2 (\|\xi_1\|_1 + \|\xi_2\|_1) \leq 4\mu_0 \gamma_3 \frac{(Re + Re^0)}{(1 - 2Ra)^2} \left[ c_0 (2Ra + 1) \|\xi\|_{1/2,R}^2 + \frac{2\beta_1 \gamma_2}{\delta_0 \nu} \|\xi\|_{RN} \right], \quad \chi|c_1(u, C, \theta_1 + \theta_2)| \leq \chi \gamma_1 \|u\|_1 \|C\|_1 (\|\theta_1\|_1 + \|\theta_2\|_1) \leq 4\mu_0 \gamma_3 \frac{\gamma_1 \beta_1}{\gamma_0 \delta_1 \lambda} \times
\frac{(Re + Re^0)}{(1 - 2Ra)^2} \left[ c_0 (2Ra + 1) \|\xi\|_{1/2,R}^2 + \frac{2\beta_1 \gamma_2}{\delta_0 \nu} \|\xi\|_{RN} \right].
\]
Here \(\gamma_3\) and \(Re^0\) are defined in (67). From these inequalities and (30) we deduce that
\[
|c(u, u, \xi_1 + \xi_2) + \chi c_1(u, C, \theta_1 + \theta_2)| \leq \mu_0 (a_1 \|\xi\|_{1/2,R}^2 + a_2 \|\chi\|_{RN}^2).
\]
Here constants \(a_1\) and \(a_2\) are given by
\[
a_1 = \frac{2\mu_0 \gamma_0 \gamma (Re + Re^0)}{(1 - 2Ra)^2} c_0^2 (2Ra + 1)^2 \left[ 6 + \frac{\gamma_1 \beta_1}{\gamma_0 (5Ra + 1) \nu^2} \right],
\]
\[
a_2 = \frac{4\mu_0 \gamma_0 \gamma (Re + Re^0)}{(\delta_0 \nu)^2 (1 - 2Ra)^2} \left( \frac{2\beta_1 \gamma_2}{\delta_0 \nu} \right) \left[ 3 + \frac{\gamma_1 \beta_1}{\gamma_0 (Rd + 2) \nu^2} \right].
\]
Let input data for problem (97) and parameters \(\mu_0, \mu_1, \mu_2\) be such that
\[
(1 - \epsilon)\mu_1 \geq \mu_0 a_1, \quad (1 - \epsilon)\mu_2 \geq \mu_0 a_2, \quad \epsilon = \text{const} > 0.
\]
In view of (105) we deduce from (103) that
\[
|c(u, u, \xi_1 + \xi_2) + \chi c_1(u, C, \theta_1 + \theta_2)| \leq (1 - \epsilon) \mu_1 \|\xi\|_{1/2,R}^2 + (1 - \epsilon) \mu_2 \|\chi\|_{RN}^2.
\]
Combining (98) and (106) we obtain the inequality
\[
\mu_0 (|u|_{Q}^2 - |u, d|_Q) \leq -c(u, u, \xi_1 + \xi_2) - \chi c_1(u, C, \theta_1 + \theta_2) - \mu_1 \|\xi\|_{1/2,R}^2 - \mu_2 \|\chi\|_{RN}^2 \leq
\]
\[
- \epsilon \mu_1 \|\xi\|_{1/2,R}^2 - \epsilon \mu_2 \|\chi\|_{RN}^2.
\]
Using (107) we deduce (73) which takes place under conditions (105). The uniqueness of the solution to problem (97) follows from this estimate and (107), (102) when \(Q = \Omega\).

Rewriting (107) in view of (73) in the form
\[
\epsilon \mu_1 \|\xi\|_{1/2,R}^2 + \epsilon \mu_2 \|\chi\|_{RN}^2 \leq c(u, u, \xi_1 + \xi_2) + \chi c_1(u, C, \theta_1 + \theta_2) + \mu_1 \|\xi\|_{1/2,R}^2 + \mu_2 \|\chi\|_{RN}^2 \leq
\]
\[
- \mu_0 \|\xi\|_{Q}^2 + \mu_0 \|u, d|_Q \leq \mu_0 \|u, d|_Q^2,
\]
and using (102) we obtain the following stability estimates:
\[
\|g_1 - g_2\|_{\Omega} \leq \frac{\mu_0}{\epsilon \mu_1} \|u, d|_Q^2 - \|u, d|_Q^2 \leq \frac{\mu_0}{\epsilon \mu_2} \|u, d|_Q^2 - \|u, d|_Q^2 \leq \sqrt{\frac{\mu_0}{\epsilon \mu_2}} \|u, d|_Q^2 - \|u, d|_Q^2 \leq \sqrt{\frac{\mu_0}{\epsilon \mu_2}} \|u, d|_Q^2 - \|u, d|_Q^2.
\]

www.intechopen.com
Theorem 13. Let under conditions (i), (ii), (j) and (31) the quintuple \((u_i, p_r, C_i, g_i, \chi_i)\) be a solution to problem (97) corresponding to a given function \(u_r^{(i)} \in L^2(Q)\), \(i = 1, 2\), and conditions (105) hold where parameters \(a_1\) and \(a_2\) are given by relations (104) in which \(\gamma_3\) and \(\mathcal{R}a^0\) are defined in (67). Then stability estimates (73) and (108) hold true.

In the same manner one can study two-parameter control problems for another cost functionals entering into (22). Consider for example the following control problem:

\[
J(x, g, \chi) = \frac{\mu_0}{2} \| p - p_d \|^2_Q + \frac{\mu_1}{2} \| g \|^2_{L^2(Q)} + \frac{\mu_2}{2} \| \chi \|^2_{L^2(Q)} \to \inf,
\]

\[
F(x, u) = 0, \; x = (v, q, S) \in X, \; u = (g, \chi) \in K_1 \times K_2,
\]

(109)
corresponding to the functional \(I_4\). The following theorem holds.

Theorem 13. Let under conditions (i), (ii), (j) and (31) the quintuple \((u_i, p_r, C_i, g_i, \chi_i)\) be a solution to problem (109) corresponding to a given function \(p_r^{(i)} \in L^2(Q)\), \(i = 1, 2\), and the conditions (105) hold where parameters \(a_1\) and \(a_2\) are given by relations

\[
a_1 = \frac{2\mu_0 \gamma_0 (\mathcal{R} + \mathcal{R}a) M_p}{(1 - 2\mathcal{R}a)^2} \left( \frac{c_0(2\mathcal{R} + 1)}{2} + \frac{2\beta_1 \gamma_2}{\delta_0 \delta_1 \lambda (1 - 2\mathcal{R}a)} \right),
\]

\[
a_2 = \frac{4\mu_0 \gamma_0 (\mathcal{R} + \mathcal{R}a) M_p}{(\delta_0 \delta_1)^2 (1 - 2\mathcal{R}a)^2} \left( \frac{2\beta_2 \gamma_2}{\delta_0 \delta_1 \lambda (1 - 2\mathcal{R}a)} \right)^2 \left( 3 + \frac{\gamma_1}{\gamma_0} (\mathcal{R}a + 2) \right)^2
\]

in which

\[
M_p = \beta_0^{-1} \left( M_p^0 + \max(\| p_d^{(1)} \|^2_Q, \| p_d^{(2)} \|^2_Q) \right).
\]

Then the estimate

\[
\| p_1 - p_2 \|^2_Q \leq \| p_1^{(1)} - p_2^{(2)} \|^2_Q
\]

and stability estimates

\[
\| g_1 - g_2 \|^2_{L^2(Q)} \leq \sqrt{\frac{\mu_0}{\mu_1}} \| p_d^{(1)} - p_d^{(2)} \|^2_Q, \quad \| \chi_1 - \chi_2 \|^2_{L^2(Q)} \leq \sqrt{\frac{\mu_0}{\mu_2}} \| p_d^{(1)} - p_d^{(2)} \|^2_Q,
\]

\[
\| u_1 - u_2 \| \leq \left( \frac{c_0(2\mathcal{R} + 1)}{(1 - 2\mathcal{R}a)^{1/2}} + \frac{2\beta_1 \gamma_2}{\delta_0 \delta_1 \lambda (1 - 2\mathcal{R}a)^{1/2}} \right) \sqrt{\frac{\mu_0}{\mu_2}} \| p_d^{(1)} - p_d^{(2)} \|^2_Q,
\]

\[
\| C_1 - C_2 \| \leq \left( \frac{c_0(2\mathcal{R} + 1)}{(1 - 2\mathcal{R}a)^{1/2}} + \frac{\gamma_1 M_p^0}{\delta_1 \lambda (1 - 2\mathcal{R}a)^{1/2}} + \frac{\gamma_2}{\delta_0 \delta_1 \lambda (1 - 2\mathcal{R}a)^{1/2}} \right) \sqrt{\frac{\mu_0}{\mu_2}} \| p_d^{(1)} - p_d^{(2)} \|^2_Q.
\]
\[ \|p_1 - p_2\| \leq \frac{(2R + 1)}{\beta_0(1 - 2Ra)} \left( \frac{\epsilon_0 \delta_0 v(R + Ra)}{\sqrt{\mu_1}} + \frac{\beta_1 \gamma_2}{\delta_1 \lambda \sqrt{\mu_2}} \right) \sqrt{\frac{\mu_0}{\epsilon}} \|p_1^{(1)} - p_2^{(2)}\|_Q \]

hold true.

Similar theorems can be formulated and proved for Models 2 and 3. Details can be found in (Alekseev, 2006; 2007a; Alekseev & Soboleva, 2009; Alekseev & Tereshko, 2010a; Alekseev & Khudnev, 2010).

5. Numerical algorithm. Results of numerical experiments for Model 2

In this section we discuss results of computational experiments related to the numerical solution of control problem (4) for Model 2. Our numerical algorithm will be based on optimality system for control problem (4) which is the analogue of relations (25), (26) and (27) for control problem (21). For the sake of simplicity we consider the case where control sets \( K_1 \) and \( K_3 \) coincide with spaces \( H^1(\Omega) \) and \( L^2(\Gamma_N) \) respectively. In this case the minimum is reached in an internal point of set \( K \) and it is possible to express optimal controls \( g \) and \( \eta \) via adjoint state by explicit formulas (see (Alekseev & Tereshko, 2010c))

\[ g = (\sigma \mathbf{n} - \nu \partial \xi / \partial n) / \mu_1, \ \eta = \theta / \mu_2. \]

Using these expressions we can rewrite the optimality system as a nonlinear operator equation

\[ \Phi(u, p, T, \xi, \sigma, \theta) = 0. \]

For its numerical solution the iterative algorithm based on Newton’s method is proposed. This algorithm consists of following steps:

1. For given \((u_0, p_0, T_0, \xi_0, \sigma_0, \theta_0)\) and supposing \((u_n, p_n, T_n, \xi_n, \sigma_n, \theta_n)\) are known, we define \( \bar{u}, \bar{p}, \bar{T}, \bar{\xi}, \bar{\sigma}, \bar{\theta} \) by solving the following linear problem:

\[ \Phi'(u_n, p_n, T_n, \xi_n, \sigma_n, \theta_n) (\bar{u}, \bar{p}, \bar{T}, \bar{\xi}, \bar{\sigma}, \bar{\theta}) = -\Phi(u_n, p_n, T_n, \xi_n, \sigma_n, \theta_n). \]

2. Then we calculate new approximations \((u_{n+1}, p_{n+1}, T_{n+1}, \xi_{n+1}, \sigma_{n+1}, \theta_{n+1})\) for \( u, p, T, \xi, \sigma, \theta \) as

\[ u_{n+1} = u_n + \bar{u}, \ t_{n+1} = p_n + \bar{p}, \ T_{n+1} = T_n + \bar{T}, \]

\[ \xi_{n+1} = \xi_n + \bar{\xi}, \ \sigma_{n+1} = \sigma_n + \bar{\sigma}, \ \theta_{n+1} = \theta_n + \bar{\theta}. \]

3. If the condition \( ||T_{n+1} - T_n|| / ||T_n|| < \epsilon \) for some sufficiently small number \( \epsilon \) is not satisfied, then we go to step 1.

Below we shall present some numerical tests which illustrate an application of the proposed algorithm to the control problem (4). The first example is connected with the vortex reduction in the steady 2D viscous fluid flow around a cylinder in a channel. As a control we use heat flux \( \eta \) on some parts of the boundary. The initial uncontrolled flow is the solution of the boundary-value problem for the dimensionless stationary Navier-Stokes equations

\[ -\frac{1}{Re} \Delta u + (u \cdot \text{grad}) u + \text{grad} p = 0, \ \text{div} u = 0 \text{ in } \Omega = \Omega_2 \setminus \Omega_1, \]

\[ u|_{\Gamma_0} = 0, \ u|_{\Gamma_1} = g_1(y), \ \left( \frac{1}{Re} \frac{\partial u}{\partial n} - p n \right)|_{\Gamma_2} = 0. \]
Here $Re = UL/\nu$ is the Reynolds number, $U$ and $L$ are characteristic velocity and length for a flow. We prescribe the no-slip condition on the solid boundaries $\Gamma_0$ (the surface of the cylinder and channel walls), a parabolic inflow profile for the velocity on the inlet segment $\Gamma_1$ and “do-nothing” boundary conditions on the outlet $\Gamma_2$. The streamlines for uncontrolled flow are shown in Fig. 1. They were obtained by solving the boundary-value problem (110) using Newton’s method. The open source software freeFEM++ (www.freefem.org) with an adaptive triangular mesh (about 3000 elements) is used for numerical solution of a linearized boundary-value problem. Usually 4 iterations were required for convergence of Newton’s method when the solution to the corresponding Stokes problem plays the role of an initial guess.

The flow separation past the body can be clearly identified in Fig. 1. In order to reduce this recirculation the vorticity functional $I_3$ with $\zeta_d = 0$ in (22) is minimized using the proposed algorithm for the dimensionless analogue of Model 2. In this case we need to use additional dimensionless parameter - the Rayleigh number $Ra = \beta GL^3 \Delta T/(\nu \lambda)$, where $\Delta T$ is a characteristic temperature difference. Firstly we choose the heat flux $\eta$ only on the cylinder surface as control. The streamlines of the controlled flow for this case are shown in Fig. 2. One can see that flow separation past the body is eliminated.

In order to obtain a more laminarized flow we expand the area of action of temperature control. In Fig. 3 the controlled flow is presented for the case when the temperature control acts both on the cylinder surface and on the nearest parts of the channel walls (marked with dashed lines in Fig. 3). The vorticity of this flow is small and there is no recirculation zone past the cylinder. An analysis of the temperature field shows that the heat fluxes on additional parts of the boundary compensate a high temperature action on the cylinder surface.

Table 1. Norm of the vorticity and drag coefficient values
In order to analyze the efficiency of different types of boundary control we calculate the norm of the vorticity $\|\text{rot} \mathbf{u}\|$ and the drag coefficient $C_D$ for different values of Reynolds number $Re$. These values for uncontrolled and controlled flows are shown in Table 1. The smallest values of these parameters correspond to the last case of boundary control.

Analogous results were obtained for the steady 2D viscous fluid flow around a cylinder in a channel with forward-facing step. The streamlines for uncontrolled flow are shown in Fig. 4. One can see a flow separation past the body and vortex at the corner. In order to reduce these recirculations the vorticity functional $J_3$ with $\zeta_d = 0$ in (22) is minimized. In Fig. 5 the controlled flow is presented for the case when the heat flux control acts both on the cylinder surface and on the nearest parts of the channel walls.

The regularization parameter $\mu_3$ plays an important role in computations. If $\mu_3$ is small then we usually obtain a flow with high temperature gradients on the cylinder surface because a substantial change of the velocity field requires powerful temperature action. This is the reason for the simultaneous use of two controls: $g$ and $\eta$. If main change in the velocity field is achieved due to hydrodynamic control $g$ then temperature control $\eta$ will play only auxiliary role and temperature gradients will be small.

In the next example we consider two types of control on different parts of the boundary. As in the first example the heat flux on the cylinder surface and on the nearest parts of the channel walls is used to avoid the flow separation past the body. Additionally the Dirichlet control $g$ on a part $\Gamma_c$ of the boundary $\Gamma$ (marked with dotted lines) is used for corner vortex suppression. Streamlines of corresponding controlled flow are shown in Fig. 6.

</table>

The flow separation past the body is eliminated and the corner vortex is absent in this case because of fluid suction at the corner. Calculated values of the norm of the vorticity and of the drag coefficient $C_D$ are shown in Table 2. It can be observed that a simultaneous application of temperature and hydrodynamic controls results in the smallest values of $||\text{rot}u||$. Moreover in this case we obtain the smallest values of the temperature gradients.

The computational experiments showed that if the initial guess is selected sufficiently close to the exact solution, then the algorithm converges for several iterations. The regularization parameter $\mu$ plays an important role. If its values are relatively large then we can not obtain small values of the functional $I_3$. But, on the other hand, the very small values of the regularization parameter can lead to the instability and oscillations in the numerical solution. An analysis of computational results shows that proposed method can be effectively used to produce flows in channels with desired dynamical properties. Some results of other numerical experiments can be found in (Tereshko, 2009; Alekseev & Tereshko, 2010b,c).

problems of admixture diffusion in viscous fluids. *Journal of Inverse and Ill-Posed Problems*, Vol. 9, No. 5, Jan 2001, 435–468. ISSN 0928-0219

This book introduces a number of selected advanced topics in mass transfer phenomenon and covers its theoretical, numerical, modeling and experimental aspects. The 26 chapters of this book are divided into five parts. The first is devoted to the study of some problems of mass transfer in microchannels, turbulence, waves and plasma, while chapters regarding mass transfer with hydro-, magnetohydro- and electro- dynamics are collected in the second part. The third part deals with mass transfer in food, such as rice, cheese, fruits and vegetables, and the fourth focuses on mass transfer in some large-scale applications such as geomorphologic studies. The last part introduces several issues of combined heat and mass transfer phenomena. The book can be considered as a rich reference for researchers and engineers working in the field of mass transfer and its related topics.
