1. Introduction

Acupuncture is one of the Traditional Chinese Medicine (TCM) and perhaps most important, by the way the world is widely used as a treatment effective, because it is more structured in terms of legislation, education and research. Until recently it was mostly known for its analgesic effects, and has an large number of research demonstrating the benefits in this area [1,2,3]. Within the thinking of acupuncture, each individual should be treated as the disturbance of energy imbalance that presents itself at the time of the session, seeking the well-known syndromic diagnosis [4]. For the same pain can have many points in common from one patient to another, but there are known as energetic characteristics that complement the individualized treatment. Some acupuncture points, but they are consecrated by its clinical efficacy, repeated year after year as part of the arsenal of the specialist training in acupuncture and traditional literature of how these professionals, translated into different languages [4,5,6]. These acupuncture points and / or their combinations and how they are applied has ensured the continuity of its increasing use by the population for this ancient technique that has survived more than 2400 years of recorded history.

Currently, the scientific world investigating acupuncture in the search, especially to understand its mechanisms of action, the "whys" of their therapeutic efficacy, as is the energy system of energy meridians of the nature of acupoints and the brain impressions stimulated by acupuncture [7,8,9]. Another line of research aims to verify the possible use of acupuncture to cure difficult diseases such as: cancer and acquired immunodeficiency syndrome (AIDS) [10,11]. Complaints such as fatigue resulting from the stress are common in acupuncture clinics, and there is research demonstrating such benefits with acupuncture in treatment of fatigue in cancer patients [12]. Many of the gains and benefits referred to as energy acupuncture are based on the classic books, such as points capable of mobilizing the qi (energy) and...
xue (blood) [4]. Assuming that acupuncture improves vitality, science wants to know what the neuro-endocrine mechanisms, underlying biochemical [11]. Another line investigates whether these potential benefits can be extended to groups specific so far little exploited in research as gerontes, children and athletes [13]. From the perspective of public health efforts are priorities immunologically vulnerable individuals, those most likely to get sick in the face of epidemics such as: children, elderly, pregnant women, immunosuppressed and immunodeficient [14]. When comparing those most vulnerable, with the demands of patients in the acupuncture clinics, as well as in the research, notes that there are large numbers of elderly (gerontes), but very little children, pregnant women, immunosuppressed and immunodeficient patients. We believe the demand is low due to cultural issues, such as children and pregnant women afraid of needles. In immunodeficient and immunosuppressed patients there is no guidance of the benefits that acupuncture could provide, and some cultural preconceptions that isolate this resource as the possibility of complementary medicine, especially in the Western. The structure of this chapter, a brief look behind the immunity from the perspective of Traditional Chinese Medicine (TCM), then moving on to a more detailed study the applicability of acupuncture in the modulation of immunity, through a literature review, whose main focus is described in the methodology.

2. The pathogenesis and immunity against the perspective of Traditional Chinese Medicine (TCM)

The Traditional Chinese Medicine (TCM) has its pillars to support in philosophical foundations of Taoism, in a period of human history where there was no technological capabilities of modern diagnostics and treatments to cure of diseases. A need for greater interaction with the nature in the preservation of life, caused the man to develop a greater capacity for observing the natural cycles of climate change, time for crops, for work and home, the search for food, and therefore the preservation of health. As a result of observation and interaction with nature, the man identified prime materials for the cure of diseases and health preservation. Sustained for historical reasons there arose a form of healing spread in a philosophical and symbolic language, which for many today who do not study acupuncture / TCM appears be something still considered "mystical" or alien to Western rational mind. To understand the issue of immunity from the standpoint of TCM, it is necessary to recall some concepts that we will describe.

For TCM, the concept of health is the harmony or balance between yin and yang, or a perfect movement of the energy flow inside the body. Yin and yang are in turn defined as part of complementary and contradictory phenomena of nature and relate to each other [5].

From this reference, was formulated ratings patterns as well as supporting the symptoms syndromic, for example to be classified as Yin: night, cold, weak, pale, chronic pathologic processes, fatigue, and classified as Yang their opposites; days, heat, strong, hyperemic, sharp, vitality. From the perspective western modern, we can say that there is a possible equivalence of classified the Sympathetic Nervous System (SNS) as yang and the Parasympathetic (SNSP) as Yin. Is
independent if the language to be Taoist symbolic or modern scientific, the body this whole time looking for this balance. Its is a dynamic process, and continue to sustain life. For the TCM the relationship health vs disease or loss of balance between Yin and Yang is related to the factors of resistance and organic etiological factors. Every day we face the many forms of climate change exposure, emotional imbalance, microorganisms, mechanical trauma, pollution, food with big load of pesticides and / or preservatives, these factors are considered etiological factors. The resistance factors in turn, are called in TCM with defense energy (wei qi) and are represented by the skin, mucous membranes, hair, controlling the opening and closing the pores and the sphincters of the body. An example that can illustrate when the body is affected by climate change like the wind-chill, it makes the hair stand on end in a shiver of cold, forming a protective voluminous layer and sequentially the pores are closed. In this state of trial protection as cited in this example, the body would result in the closing of the pores to retain the internal heat, which continued for more time will become pathological. This imbalance is expressed by some physiologic indicators of syndromic diagnosis of TCM.

Another example are some cases of urinary incontinence in the elderly, where the deficiency of Yang energy, represented by the weakness pelvic floor muscles, predisposes to not control the sphincters.

Figure 1. Pathogenic Factors vs Defense Factors

In this Figure 1 is showing two situations where the disease is established, because the defense factors are weak, or because the pathogenic factors are very strong, as occurs in viral epidemics where there is often an apparently healthy

Individual’ immune profile might get sick. It is necessary to remember that when the TCM was formulated more than 2400 years ago, we had no knowledge of physiology, anatomy, biochemistry, and so little understanding of the immunology currently available for modern science. Is understandable within the context of the time theories were based on possibilities resources and understanding of man’s relationship with the natural phenomena.
3. Applicability of acupuncture in the modulation of immunity: A literature review

3.1. Initial considerations and objectives

It is consistent the applicability of acupuncture in various pathological conditions. The modern science research resources to enhance health and quality of life. We understand that all possibilities to become viable are welcome. Although there are benefits of acupuncture modulation of immunity, there are gaps of knowledge, such as the best treatment techniques, which would be the best biochemical markers, which are the best acupoints. There is much information about research in this area, but they are highly dispersed, which causes difficulties in the conclusions, and thus clinical applicability.

The aim therefore of this review is to compile and discuss the scientific literature regarding the efficacy of acupuncture in modulation immunity.

3.2. Methodology

As from the selected article was organized some data that can help to support future work or point out gaps in knowledge, regarding the applicability of acupuncture in the modulation to immunity, choice of biochemical markers and immunomodulators acupuncture points. The use of systematic reviews as a means of research methodology, has increased, and has been shows to be of great contribution and impact internationally [15]. To organize this chapter were considered scientific papers from journals, scientific repositories, MEDLINE, PUBMED, bibliography of articles on manual search, the Cochrane Library. The keywords “acupuncture and/or electroacupuncture in treatment of:” cancer”, “immunossupressed”, “immunodeficiency”, “allergic process”, “inflammation process”, “AIDS” and “modulation to immunity with acupuncture and/or electroacupuncture “. The reference lists of studies retrieved were examined to capture any other potentially relevant articles.

The inclusion criteria were:

a. Publication between january 2001 to december 2011. (The period was limited intentionally, because they understand that there was growing improvement in the methodology of scientific research, as well as growing interest in the field of acupuncture).

b. Clinical interventions and / or case studies, contain a description of immunological and biochemical markers, as well as the acupuncture points.

c. Experimental studies in human and / or animal, contain a description of immunological and biochemical markers, as well as the acupuncture points.

d. Reviews of clinical effectiveness of acupuncture, involving the key words.

e. Study of mechanisms of action of acupuncture modulation of immunity.
Studies were excluded if they:

a. Used mixed intervention with other therapeutic techniques besides acupuncture and electroacupuncture, such as medication, surgery, physiotherapy.

b. Used mixed intervention with other techniques of Traditional Chinese Medicine such as: moxibustion, herbal medicine, hot needles, auriculotherapy, bleeding and cupping.

From the variables studied aimed to answer the following questions:

a. Acupuncture is effective to strengthen the immunity?

b. What are the diseases or conditions are more studied?

c. What are the most appropriate markers to study the immunomodulatory effects of acupuncture? What are the most appropriate acupuncture points and designated for immunity?

d. What are the acupuncture techniques most frequently used in research on modulation of immunity?

3.3. Results

The initial search identified 79 studies the databases. After reading these articles should were select and evaluated 67 relevant papers (Table 1 and 2). Table 1 shows the experimental and clinical studies with acupuncture, by humans and animals. In the Table 2 only the studies for style of a systematic review and/or models involving mechanisms of action of the immunity response to acupuncture. The summary of the data, were ordered by publication date, plus their respective authors, type of population, acupuncture technique, acupuncture points used and the main results or conclusions of the studies. From these structured to Figures 2 and 3 where only the most relevant results and those that are repeated in different papers, were considered. Tables 3 to 7 are summarized also derived from the contents carried compiled.

It can be seen by looking at Figure 2, the acupuncture point more tested in experimental studies in rats and humans was St 36 (Zusanli), together making a total of 39 articles (73.5%) of articles mentioning acupuncture points tested, and with animals, especially rats (14 papers) and humans (25 papers). As related to the point ST36 with the population profiles found in animals, 48% with inflammation [16,18,23,26,30,39,41,46,48,54,59], 26% of post-surgical, trauma or stress induced by cold [21,31,34,38,56,57]), 13% with cancer [48,50,58], 9% with allergic processes [42,52] and only 4% of healthy individuals [35]. However in humans, there were no highlights for either disease as an object of study, and found the use of St 36 in inflammation [63], cancer [47], allergic rhinitis [17,27,29], elderly [19,65] and athletes [24], healthy [40], depression [64] In humans, the equivalence point with ST36 (Zusanli) appears LI4 (Hegu), with 14 and 12 papers respectively, and in 8 of these items, the points LI 4, and ST36 are used simultaneously. In animals there was only one papers used LI 4 acupuncture point, separately, being expressed clearly in Figure 2.

Figure 2. Main immunomodulators acupuncture points cited on the papers.
In view of the purposes stated in the methodology of this review, prepared to Figure 3, which shows the distribution of numbers of papers regarding the use of the techniques of acupuncture (ACP) and electroacupuncture (EA) or both simultaneously (ACP + EA). Of the 56 papers that reported the technique used, 26 papers used ACP, 27 EA and 2 used both techniques (ACP + EA).

Elaborated the tables 3 to 7 on the basis of immunological and biochemical markers found in the papers of this study.

Table 3. Number of papers that used Interleukins (IL) vs effects of acupuncture or electroacupuncture.

Table 3 shows the number of papers mentioning the Interleukins (IL) and immunological markers in studies with acupuncture or electroacupuncture. If we add all papers, where after acupuncture decreased the Interleukins, make up 58% versus 27%, which increased and 15% that have not changed.
Table 4. Number of papers that used markers CD vs effects of acupuncture or electroacupuncture.

Table 4 expressed a distribution of the papers mentioning the immunological markers of type CD. It is felt that there was a higher concentration in the selection of CD4 and CD8 markers. Important to note that the use of CD11b, CD16, CD19 and CD59, it is one and the same article [40]. There is a distribution of 72% of the papers where there were increases in CD, compared with 28% reduction and no article with “no change” after the intervention with acupuncture or electroacupuncture.

Table 5. Number of papers used for Blood cells vs effects of acupuncture or electroacupuncture.

In the Table 5 were grouped the blood cells, relating them to their results after the intervention of acupuncture or electroacupuncture. Were the most representative use of total leukocytes, primarily found in 38% of the papers, followed by, lymphocytes and neutrophils, with 26% each, and eosinophils, monocytes with 5% each.

Table 6. Immune-biochemicals markers after the intervention; effects of acupuncture or electroacupuncture.
In the Table 6, are grouped the markers that were present in at least three or more papers. Were excluded from the markers that were cited in the minority (IgG, cortisol, CGFS, lymphocyte apoptosis, VIP (vasoactive intestinal peptide), substance P, reactive oxygen species (ROS), nitric oxide and macrophages).

Table 7. Distribution of the presence of terms of service and Symptoms Inflammation X after the intervention effects with acupuncture and electroacupuncture.

To end the presentation of results was elaborated in Table 7 that grouped the papers about some terms that, although generic, were explicit in the results and / or completion of the articles studied. Since the terms chosen: inflammation and clinical symptoms. Of the articles that included in their conclusions applicability of techniques for ACP and EA the terms inflammation, in the 88% of the papers cited have demonstrated decrease, and only 11,2% cited, no change in the inflammatory process. No papers cited the occurrence of increased inflammatory process. When refers to symptoms have been reported in articles 15, and these 86,6% it is stated that reduction of pathological symptoms studied, and there were no changes 13,3%. No papers mentioned that the pathological symptoms increased. Among the symptoms referred to in these papers are specific: present in respiratory allergy rhinitis, edema, depression, physical exhaustion, adverse effects of chemotherapy and anxiety.

3.4. Discussion

3.4.1. As for immunomodulation effects and clinical efficacy

The ACP and EA its shares in neurophysiology and molecular basis [70]. Its effects and mechanism of action can be evaluated by magnetic resonance imaging and computed tomography [70]. Ma [71] following another line of study, demonstrated the immunohistological nature of the meridians and acupoints, where he verified that there is high concentration of nitric oxide. The immunomodulatory effects of ACP and EA are confirmed by studies with diverse biochemical markers described in Table 1.

They are among the principal effects immunomodulatory:

a. Decrease of cellular apoptosis
b. Increase cytotoxic activity
c. Synergism biochemical between the EA and neurotrophyn(NGF)
d. Mobilization of corticosterone, endorphine and ACTH.
e. Pro-inflamatory and antinflamatory effects.
We observed that acupuncture has clinical efficacy in some situations, as in allergic processes, and in pain [1,2,3]. In other stages as inflammation can reduce or block the inflammatory process, but will depend on the stage he is and also the origin of this process. Recall for example in case of tendonitis, that acupuncture can reduce pain, edema, hyperemia, provide gain range of motion. However the origin of tendinitis is caused by repetitive strain, compression of nerve roots, weakness or muscle shortening, which in these cases need conventional physiotherapy intervention, exercise, manipulation, and / or resting muscle. Finally we have a group of pathogenic conditions where acupuncture may improve symptoms and quality of life, but the effect is still very poor immunological results and research in the area are being made, as in the case of degenerative processes, immunodeficient [10] and immunosuppressed patients [60]. In patients or cancer models, as well as elderly, where usually has low of immunity defenses, the acupuncture and electroacupuncture demonstrated in this study that increases the immunity, being a possibility of complementary therapeutic resource. In the acute or chronic inflammation and allergic processes ACP and/or EA demonstrated modulate the immune response, decreasing the hyperresponsiveness of the markers pro – inflammatory [48].

3.4.2. As for the immunologic markers

3.4.2.1. Interleukins (IL)

Interleukins (IL) constitute a class of cytokines, and soluble proteins that act as humoral regulators at nano or picomolar concentration by modulating the functional activities of cells and tissues through specific receptors of target cells [81]. In this study, we included studies of acupuncture in humans and animals, whereas several groups with different immune deficits, such as those with cancer, allergies, physical exhaustion, inflammation, and studies with healthy groups. In general there were more studies demonstrating that after acupuncture decreases interleukins, with 58% of research, compiled and summarized in Table 4. Were 27% that increased and 15% of the research there were no changes. It is understood that specificity is in the release of each group of interleukins. Some authors demonstrate that IL-6 [82] and IL10 [83] may increase after intense physical exhaustion, simulating an "inflammatory reaction" while IL8 increase but at a later continuous process of exhaustion [83]. In this review, it was shown that IL6 interleukin decreased after acupuncture in 5 of 7 of the articles has been markers, slowing a reduced immunological response. The interleukin appeared in two papers which show increase [66,68], where tree have decrease [17,63,67] and two no change [32,61], the results so far divided. Tian et al [18] in a research with EA says it is still unknown whether electroacupuncture can keep the balance between the anti-inflammatory and pro-inflammatory cytokines. He further states that the specific mechanisms of regulation of IL4, IL10 and IL13, when acupuncture have decreased these pro-inflammatory cytokines not been totally elucidated. Perhaps this explanation justifies the inconclusive results of the use of IL10 in our review.
3.4.2.2. Blood cells

a. Total leukocyte and interleukins acute stage

As for total leukocytes, as shown in Table 6, there was a decrease in 43% of research [36,48,54]. Had increased by 43% [44,48,55] and in 14% of papers no change [47]. Is remarkable to note that the papers that report that acupuncture increased the total leukocytes, are all with a population of leukopenic patients after chemotherapy, and in papers that report decreased after acupuncture are affected population inflammatory process. This data, demonstrate that acupuncture can both increase or decrease the inflammatory response, corroborating with Zijlstra [68], whose author claims that acupuncture has immunomodulatory effect. According to Silva [84], the leukocytes produce IL-1 and IL-6 among the main defense markers in acute inflammatory response. Looking at Table 4 the papers that were used as a marker of immune IL1, 86% after acupuncture had a decrease [32,51,63,64,72], and 14% no change [66]. The IL-1 has a similar function to the tumor necrosis factor (TNF), which is to mediate the innate immune response in especially inflammatory type. The main cellular source of IL-1 second as report by Abbas [85] are the activated mononuclear phagocytes.

Enhancing the action of acupuncture and electroacupuncture in immunomodulation of the acute process was found 64% reduction in the articles that have been used as a marker of TNF [16,18,23,41,67,68,72], compared with 27% of the articles without change [61,64,66], and only 10% with an increase [22]. The studies in oncology are of unquestionable importance. Leukopenia is a constant in cancer patients submitted to chemotherapy. In the research compiled here, showed that the ACP and EA can modulate in a positive way by increasing leukocytes [44,48,55]. Lu, W. et al [44] came to the conclusion in a study involving humans with EA after chemotherapy there was an average increase of 1221 white cells / ul. These data are encouraging, especially if added to increase the cytotoxic activity of NK cells, as reported by other authors [11,21,31,35,43].

b. Lymphocyte

As for lymphocytes, no conclusive interpretation in the literature, for some authors, such as Lu et al [55] and Pavão et al [65], that acupuncture said increases lymphocytes, while others such as Kou et al [36] and Ferreira et al [54] found a decrease in their research.
This apparent contradiction of results must be interpreted in light of the therapeutic objectives that acupuncture provides to different pathological conditions. Evaluating the articles can see that those among populations where there was an increase of lymphocytes, are patients with cancer and inflammatory processes. In these cases, therefore it is desirable that there is an increase in defenses. Furthermore, papers which show after acupuncture lymphocytes decreased were evaluated in a population with predominantly inflammatory process, therefore also a desirable result. It is concluded therefore that acupuncture has an immunomodulatory effect, can raise or lower the lymphocytes, depending on immuno-pathogenic requirements. In cellular immunity, T cells CD4+, activates macrophages to destroy phagocytosed microorganisms while CD8+ T lymphocyte, kill infected cells which intracellular microbes [85]. The Complement System, consisting of serum glycoproteins and cell membrane, which along with the antibodies form the main mediators of the humoral immune response in the inflammatory process [85]. The compiled studies show that acupuncture helps in stimulating this pathway of immune response, with 72% who used the results of immunological markers CD system, pointing to an increased presence of complement, after the intervention [40,49]. All research were performed in humans with cancer and also healthy, submitted to physical exhaustion, pointing to possibilities of acupuncture not only strengthen the immune process, but also be preventive. As for the markers of the complement system there was no consensus on what would be the most suitable. Of the five papers in the literature, the data were repeated if more CD4+ and CD8+ T cells.

The lymphocytes T, still produce CD3, IL2, IL4, IL5, IL6, IL8, IL10, IL13 and IFNy. With this comprehension is justifiable the increase demonstrated in the distribution illustrated in the Table 4. The papers, where CD3, CD4 and CD8 presented decrease after the acupuncture [36,54], were singularly at the same population profiles where there were lymphocytes decrease (stress, inflammation). Agrees, therefore desirable this decrease, like form of blocking the of the inflammatory process.

3.4.2.3. Immunoglobulins (Ig)

The immunoglobulins or antibodies represent a glycoproteins family related structurally, produced by the lymphocytes B, linked or secreted by cellular membrane [85]. Among immunoglobulins, find IgA present in great quantity in mucosal. Akimoto [24] and Gleesen [87] show that IgA salivate decreases in exercises exhausting case, as well as the population of total lymphocytes predisposing especially athletes population the diseases of the respiratory treatment. The results expressed in the Table 6, they demonstrate that the acupuncture can increase IgA indices after exhaustion as in physical depletion cancer processes [24,50,60], signalling for acupuncture possible benefits in immunomodulation. Other immunoglobulin related in the papers was Ig E. According Abbas. [85], individuals with allergic process is found high levels of immunoglobulin IgE, in response to environment allergens, in the same way that IL4. In 100% of the papers that used IgE as markers, the results found after the acupuncture went of reduction in the serum levels [26,29,52,53]. In the same way found a coherence in the citations of other authors, white respect to decrease to IL4 after the acupuncture...
Such fact corroborates with a tendency for consensus that the acupuncture effect is immunomodulators in the allergic processes, being. Therefore IgE and IL4 are the best markers for researches and clinical support.

3.4.2.4. Markers of adaptive immune response

According to Abbas [85] the immunity also known as it specifies is mediated by the lymphocytes and stimulated by infectious agents. It characterizes by the rare specificity of the distinct macromolecules and memory. They make her part the liberation of comprises the following cytokines: TNFα, IFNy or gamme (g) that then it stimulates the interleukin proliferation IL2.

The production of interferon IFNy (in animals) and IFNg (in humans) is produced starting from NK cells activated and lymphocytes T (effectors). Is consistent data that demonstrate the correlation among the increases of NK cells and IFNy/g. The studies that were used of interferon IFNy/g with marker, there were 50% of the papers with increase [28,57], 25% with reduction [41] and 25% no change [26] after the acupuncture or electroacupuncture. As for IL2 also followed the same line of results, with increase serum levels predominance with 75% of the papers that were used of this marker relating increase [17,28,57] and 25% decrease [15].

Although NK cells are part of the innate immune response, and not the adaptive response, this class of lymphocytes trigger the release of the adaptive response through the production of interferon (IFN). In our studies was verified in the Table 7 that in 100% of these papers, were used of the NK cells as markers, there was increase after acupuncture and electroacupuncture [11,21,31,35,43]. There were no papers that are used as a marker of NK cells expressed reduction. Therefore the result obtained in studies of NK cells are consistent to those found with IFN, demonstrating that the ACP and EA immunomodulators.

3.5. As for the acupuncture points

The acupuncture point is specified location along the route known as meridians. Although known by physicians for thousands of years, acupuncture points or acupoints as they are known, attracted a few decades ago the condition of being surveyed with modern resources. Chen et al [69] showed that the acupuncture points and meridians is increased norepinephrine, and modulation of arginine, derived nitric oxide by the sympathetic nervous system (SNS). Ma et al [71] also found high concentrations of nitric oxide, and these did not suffer reduced to nitrate by bacteria in skin. The acupoint ST 36 has its original name as Zusanli, in chinese ZU

 means foot, and three SAN LI distance, translated as the point that "tones the body to walk long distances" [6]. It is a point used in clinical routine as a useful point to treat fatigue and low immunity, and analgesic, which goes against the findings in the studied articles, where the results shows that the ST36 is the most researched, both in humans and in animals and is its present in 73.5% of the papers. We believe that this effect occurs because of the ease and stability in the anatomical containment and retention in rats when compared with other points, and because there is an established animal model in this location [52]. The LI 4 was the second most cited in humans, with 12 papers. This acupoint is easily located on the back of the hand between the first and second metacarpal, within the second half of the metacarpal bone, is very
suitable in the literature for improving immunity in particular inflammation, fever, and as a powerful analgesic [4,5]. However it is observed that no uniformity in relation to the use of this point in the human population under study, with respect to pathologies. It was used in work with proposed immunity in asthmatic subjects, anxious, healthy, sedentary and athletes. In animals, however there was only one article that used the LI 4.

We believe that is due to the high pain sensitivity, found in the distal portion of forepaws and little anatomical support, which would make the containment of animals and maintenance of the needles. Although escarces research, the use of aggregate LI 4 acupoint appears to others. Can not conclude therefore that the immunomodulatory effect shown is resulting from the isolated use of LI 4, as occurred with ST36.

3.6. The use of techniques of acupuncture (ACP) and electroacupuncture (EA)

The act of dry needling, known with acupuncture is the most technique standard of Traditional Chinese Medicine. Known millennially is widely used in clinical and research of acupuncture in humans and / or animals. In our study we noticed an homogenic distribution between the techniques, in the papers that used the ACP with 47% against 49% who used EA, and 4% with both techniques: ACP + EA. It was found as expressed in Figure 3 a greater number of papers with ACP in humans, animals and against EA was correspondingly higher. As the technique of acupuncture to more classic and old, it’s understandable that it is more accepted in research with humans, both for its ease of operation, whether the receptivity of the volunteer. Recalling that there for fear of “get a shock,” in EA justification is consistent with other authors [2].

Electroacupuncture compared with classical acupuncture with dry needling, is relatively more recent In approaching to research, and clinical applicability has much to be investigated, especially as regards the physical parameters that EA should follow to achieve their therapeutic effects [3], although their use is spreading might rate around the world. Cabio- glu [73] dont differs in its conclusions, the ACP and EA, allocating both the fact that modulate the immune system for local, neuronal and neurohumoral expression.

The ways in which EA works in the body is well studied with regard to their analgesic effects [2], but very little about their immunomodulatory effects in order to differentiate it from ACP. In our studies we found only one papers [78] which conclude that differences in the various substances to be detected, demonstrated in Table 2. The way the immune mechanism of action of EA suggested by this author proposes that EA inhibits excessive ACTH in the processes of stress. Johnston et al [11] studying the mechanism of action of ACP on cancer prevention found that there is an increase of cytotoxic activity of NK cells by cross effect between neurotransmitters and immune system (nitric oxide, endorphins, and cytokines). Remember that EA in the case of the effect of electric current enhances the release of endorphins, a mechanism already well studied in analgesia [3]. By crossing the use of EA to the research, it was not found relationship as the selection of immune-biochemical markers. However the majority of studies with EA, were carried with inflammation experimental models. It is believed that because of the ease induction of inflammation in animal models it has been a relevant factor and consequently represented by a large percentage (70%) of perpers with EA.
4. Final remarks

The studies compiled in this chapter, shows that the ac and EA are effective in the modulation of immunity. In these final remarks aimed to answer the questions proposed in this study.

The best markers for acute inflammatory processes are: IL1, IL6 and TNF alpha, and it is desired decrease in majority cases with ACP and EA. The best markers for allergic processes are IgE and IL4.

With respect to count of eosinophil cell, was not conclusive for the scarce number of papers in which they were present. There were no articles describing the C-reactive protein (CRP) as a biochemical marker. We recommend its use in future research. Is relevancy the number of papers that relate in their conclusions, the reference to the generic term of “inflammation” as well as of “clinical symptoms”. As described in the methodology, were excluded studies which were based on exclusively on symptomatic evaluation, but in 15 papers appear in their conclusions with immunological and/or biochemical markers, the terminology such as inflammation and symptoms. We believe it is a way to supplement the data by adding a reference to qualitative and quantitative, which has its importance and merit. The ST36(Zusanli) acupoint, was the most studied regarding immunomodulation in humans and animals and to for demonstrating satisfactory effects. We recommends your use in the clinic and research. The LI 4(Hegu) acupoint was so as screened for the ST36. However all the research this point appears along with others. We suggest to research the LI 4 acupoint in modulation of immunity, in an isolated manner, because can not conclude that the immunomodulatory effect shown is resulting from the isolated use of LI 4, as occurred with ST36. We suggest comparative research between the ACP and use of EA modulation of immunity. It is necessary also to EA more research in humans, because we observed that most research made in this technique occurs in animals. The modern science advances to each moment, for wide steps, especially with regard to technological resources for evaluation. However the human suffering still persists, especially for the ones that do not have access to sources. As a researcher and expert in acupuncture more than two decades ago, we imagine there is still understandings that underlie the basic theories of TCM, acupuncture with respect to the future will be revealed comprehensible from the viewpoint of immunology.
