Chapter 8

Leadership Initiatives for Health and Safety Risk Management Systems in a Small Construction Company: A Case Study

Subashini Suresh, Chike Oduoza and Suresh Renukappa

Additional information is available at the end of the chapter

http://dx.doi.org/10.5772/intechopen.80697

Abstract

The need for leadership in the construction industry has been greater due to the fact that health and safety has become an important business tool to reduce accidents to save lives and minimise injuries. This chapter demonstrates the importance and role of leadership for managing risks associated with health and safety aspects in small construction companies. A case study of an Italian family run small construction company is investigated and reported. A diagnostic tool Leadership and Worker Involvement toolkit was administered in the company. The toolkit had assessment levels (walking, running and sprinting). Analysis showed the company was at walking and running stages in various aspects. But the leadership aspiration of the company was to reach the ‘sprinting’ stage as a long-term target and sustain it to minimise health and safety risk. A holistic approach was developed to achieve the leadership aspirations of the company. In conclusion, the role of leadership in small companies is to understand the importance of H&S aspects and develop strategies which are then embedded in the processes of the companies to minimise H&S risks for their sustainability and competitiveness. This chapter is beneficial for professional at site, project and programme level and for leadership team.

Keywords: enterprise risk management, leadership, health and safety, risk management, small companies

1. Introduction

Every day, people die as a result of occupational accidents or work-related diseases—more than 2.78 million deaths per year, according to [1]. Additionally, there are about 374 million
non-fatal work-related injuries and illnesses each year, many of these resulting in extended absences from work. Construction is a major industry providing jobs to millions of people and contributing to individual countries and the world economy. With the construction industry being notorious for safety, this condition has compelled companies to improve their safety performance. There are at least five reasons which demonstrate the importance of safety for construction companies [2]: lack of safety; increase probability of accidents; increase human suffering through injuries; accidents leading to disabilities; and fatalities. Governments around the world have laws that require construction organisations to provide safe work conditions and adequate supervision. Lack of safety, therefore, may lead to prosecution or claims, which will become the source of extra costs and adverse publicity. When an accident happens, the morale of workers is weakened. On the contrary, accident prevention programs strengthen morale and improve on-site productivity. A good safety record and proven safety management system is a valuable marketing tool to attract new clients and support business expansion. A safe operation of workplace is considered as a moral obligation imposed by the current society, thus good safety practices are essential to improve and maintain reputation; and safety management program contributes to the financial health of construction companies by helping them avoid costs associated with accidents. An accident incurs both direct and indirect costs as well as insured and uninsured costs. Sun and Zou [3] found that an accident can cost up to a $1.6 million. The hidden costs could be 36 times greater than the direct costs of the accident [4].

In most countries, the rates of accident and injury prevailing in the construction industry are higher than what prevails in other industries. For developed countries, Idoro [5] found that the United States construction industry currently accounts for over 22% of all occupational fatalities in the entire United States even though it employs less than 7% of the country’s workforce. However, according to the UK Health and Safety Executive Warren [6], each year in the construction sector alone, 4% of workers suffer from an illness they believe to be work-related and 3% of people suffer from a work-related injury. That is 79,000 people have musculoskeletal disorders.

The situation in developing countries is worst because research studies discovered that accident and injury rates in many of the developing countries such as Kingdom of Saudi Arabia [7]; Nigeria [8, 9], Thailand [10], and Tanzania are considerably higher than in European countries [5]. Mbuya and Lema [11] are of the opinion that in most developing countries, safety consideration in construction projects delivery is not given a priority and the employment of safety measures during construction is considered a burden Enshassi et al. [12]. Also discover that in many developing countries, the legislation governing Health and Safety is significantly limited when compared with UK. They report further that there are rarely any special provisions for construction on workers' safety and the general conditions for workers are often not addressed.

Health and safety globally is enacted by varying regulations, standards, model and acts. The International Labour Organisation (ILO) publish a database of current occupational health and safety legislation globally, described in Table 1 are countries who apply occupational health
and safety law, who is responsible for ensuring regulation, standards are being enacted and the occupational health and safety laws they are compliant with regards to training and development of their given work forces. In spite of this every 15 seconds, a worker dies from a work-related accident or disease. 317 million accidents occur on the job annually; many of these resulting in extended absences from work. The human cost of this daily adversity is vast and the economic burden of poor occupational safety and health practices is estimated at 4% of global Gross Domestic Product each year [13]. Therefore, investment in health and safety initiatives is critical to a company’s sustainability and future competitiveness.

Lee and Halpin [14] discovered that in many of the countries where safety legislation exists, the regulatory authority is weak and non-existent and employers ‘pay lip service’ to regulations. Koehn and Datta [15] further discover that in developing countries, injuries are often not reported and the employer only provides some form of cash compensation for an injury to the employee. Suresh et al. [7] study concluded that it is possible to improve construction industry Health and Safety through effective enforcement of existing Health and Safety laws. In addition

Table 1. Health and safety in 12 different countries.
to the company leadership team recognising the importance of health and safety especially for small companies which constitute to more than 90% in the construction industry.

Health and Safety is always considered as a management issue in which the top management team, who has the authority to allocate resources and enforce organisation’s policies, plays a key role in successful health and safety management [16]. The top management team must be willing to accept responsibility for the safety of their employees and must consider safety as an integral part in conducting business. They need to announce and demonstrate their safety commitment as well as stimulate safety awareness from the rest of their employees. Therefore, a safety program or any other implementation of a safety management system must start from or be supported by top management.

2. The role of leadership for health and safety

Without management support, safety is degraded into behavioural issues, such as asking workers to work with care and to wear protective equipment. Proper behaviours are, of course, necessary, but it is important to remember that humans are prone to error. Changing people’s mindset and implementing a safety management system are more important and effective to counter safety issues [17]. On the other hand, safety should not only be the responsibility of top management. Due to the complexity of the nature of safety, concerted efforts by all stakeholders, directed at all levels in the influence hierarchy are required to achieve a sustained safety improvement [18]. Everyone in the organisation must be involved and accountable. Sunindijo and Zou [19] stated that misalignment of management commitment and subordinates’ actions lead to continuous unsafe conditions of work. More so the concepts of safety by the managers are not fully disseminated to their subordinated to take measures on the construction site. These attribute to lack of safety leadership [20].

Tyssen et al. [21] noted that effective leadership plays an important role in ensuring the success of construction project facing a high degree of uncertainty. A project team will either succeed or fail largely by the quality of the leadership skills of project managers. Therefore, strong safety leadership should be the key for improvement.

The roles of leadership are distinct from those of managers. Health and safety managers hold employees accountable to health and safety and typically held accountable for outcome numbers. Thus, they use outcome numbers to direct the behaviour of those who report to them. While health and safety leaders motivate others to be self-motivated and self-accountable for health and safety go beyond the call of duty on behalf of their co-workers’ safety, health and well-being [22]. Health and safety leaders also hold people accountable for accomplishing proactive process activities that can prevent harm and lower injury rates.

Most of the leadership research has focused on outcomes such as productivity, profit, and worker satisfaction as their criteria, and very few research studies have looked at health and safety as a criterion for measuring leadership effectiveness. This is surprising, given that
Creating a safe workplace and promoting effective leadership are key goals of most modern organisations. Yet it cannot be assumed that similar leadership behaviours will be associated with effectiveness in health and safety as with other outcomes because safety, unlike other organisational outcomes is intangible. Good safety performance culminates in non-events which are not self-reinforcing. Thus, in order to develop and sustain employee motivation for safety it is likely that leadership in construction projects will require certain communication and motivational skills, which may differ from those required to fulfil task orientated goals.

Cattell et al. [23] noted that productivity is about getting the best value from all inputs across the whole value chain and for this, there needs to be sustained improvement in leadership, culture and processes. Furthermore, Ribiere and Sitar [24] referred leadership behaviour as ‘leading through a knowledge lens’. Leading through a knowledge lens gives some special characteristics since it is dealing with knowledge workers having specialised expertise, leading them can be done only by intellectual power, conviction, persuasion and interactive dialogue, it requires skills that build confidence and engagement. Therefore, leaders should establish trust and commitment that will help the knowledge organisation to achieve its business goal. Leadership initiatives for health and safety risk management systems in a small construction company is paramount as construction workers are already at a higher risk of accidents in construction than in any other industry.

3. Does size matter for health and safety?

The employees of small companies have less experience, less education and are younger than employees of large companies. Moreover, they are not conscious of the risk they confront because of their lack of knowledge and information about H&S. Lin and Mills [25] research in Australia showed that small companies did not consider they have to pay attention to H&S administratively. On the other hand, large companies consider that the H&S needs to be included in the administrative system and in all the projects developed by the company. H&S is not a priority in small companies for several reasons. First, they are economically vulnerable, which make them consider that investing in H&S is not profitable as the benefits are perceived in long term. Furthermore, owners and managers tend to take responsibility of all managerial aspects of the company, without having any management knowledge and training. Also, as the frequency of accidents is in these types of companies is low, owners tend to misinterpret these facts [26]. In order to have a more specific analysis of the size of the companies these workers belong to, the range of the number of employees followed the definition of SME from the European Union, which is used also by the UK government. In terms of quantity of employees, a SME is described as follows:

- **Micro business**: compound of less than 10 employees.
- **Small business**: compound of less than 50 employees.
- **Medium business**: compound of less than 250 employees [27].
Small businesses in the UK account for 99.3% of all private sector businesses at the start of 2016 and 99.9% were small or medium-sized (SMEs). The combined annual turnover of SMEs was £1.8 trillion. Just under a fifth of all SMEs operate in the construction industry [28]. These numbers show that there is a significant presence of SMEs in the industry, thus it is important for the construction sector that these types of companies implement H&S practices in the workplace in order to diminish accidents and any other risks that affect their workforce and people around the construction site. Small and medium enterprises are being increasingly recognised as “the life blood of modern economies” [29]. Even though this was stated more than a decade ago it still stands true reflecting on the statistics. Therefore the role of leadership for H&S in a construction small company was investigated using the leadership toolkit.

4. Leadership toolkit for health and safety

The Leadership and Worker Engagement toolkit was developed by the construction industry’s Leadership and Worker Engagement Forum in UK to help contractors and managers learn how to make health and safety improvements in their businesses. This contains of assessment sheet and then knowing the status and way forward (Figures 1 and 2). The assessment is in the table below:

<table>
<thead>
<tr>
<th>Building Block</th>
<th>Description</th>
<th>Statements: Which of the following applies to your organization?</th>
</tr>
</thead>
</table>
| Commitment     | The importance you and your workers attach to H&S.          | 1. Neither managers nor workers are interested in health and safety: even if they get caught, they don’t get caught out. At most, individuals look after their own safety.  
2. Managers aren’t dedicated to ensuring that the essentials of a health and safety management system are in place. They regard it as an added burden and will not take responsibility for ensuring that their workers are safe.  
3. Managers don’t presume accidents happen by their own negligence.  
4. Managers don’t believe health and safety performance is important (e.g., by making health and safety policy an integral part of the organization). Workforce doesn’t manage environments.  
5. Risk management and the workforce are isolated from the health and safety policy and from procedures in terms of health and safety standards, (e.g., they volunteer ideas and suggestions but aren’t involved), and the workforce ideas aren’t taken into the decision-making process. |
| Worker Engagement | The involvement your workers have in H&S decisions. | 1. Self-assessment: workers tell us what to do regarding safety and health.  
2. Workers have a poor understanding of the benefits of our health and safety procedures.  
3. Workers provide information to their managers to help them improve their own procedures.  
4. Workers are not listening to workers about health and safety issues.  
5. Training and professional development in health and safety are outside the scope of the organization.  
6. Workers are given the responsibility to make sure health and safety decisions are taken and followed up. |
| Prioritisation of Health and Safety | The attention given to H&S compared to ‘getting the job done’. | 1. Health and safety is not taken seriously. Production always takes precedence.  
2. Health and safety risks are taken seriously to ensure compliance. Health issues are not considered as a risk when planning business activities.  
3. Health and safety is managed in a systematic manner.  
4. Health is not given equal status with productivity. This is for business and economic reasons. Workers feel they can only work in a safe manner when they feel they have the skills and knowledge to do so. |
| Compliance | How the organization is complying with its H&S responsibilities. | 1. Rear compliance. Technicians are unaware of policies and procedures.  
2. Health and safety risks and procedures are often overlooked when an accident occurs. Health and safety audit is not taken seriously.  
3. Compliance is measured in a systematic way.  
4. Compliance is measured using procedures which are systematically reviewed. |
| Measurement | The way H&S is measured. | 1. No measurement of health and safety in place (e.g., accident rates are not monitored).  
2. Measurement of health is based on the number and type of accidents.  
4. Measurement of safety and health is measured systematically, in addition to the financial aspects of the business. |
| Organisational Learning | Learning from experience on H&S. Lessons learned are communicated to workers. | 1. Workers learn from mistakes only after an accident occurs.  
2. Workers are trained in their work.  
3. Learning only formally takes place immediately after accidents, without any review or reflection on the accident. Learning may be an after-the-fact event.  
4. Learning is an integral part of the accident review process. Learning and lessons learned are shared with others.  
5. Learning is an integral part of the accident review process. Learning and lessons learned are shared with others. |

Figure 1. Leadership toolkit.
areas of: commitment, workers engagement, prioritisation of H&S, compliance, measurement and organisational learning. There are five options for each of the areas and the participant should choose one statement which applies to their company/organisation.

Once the options are chosen in Figure 1 the next step is to analyse the data to identify which state the company is i.e. starting block, getting going, walking, running and sprinting (Figure 2). Thereafter suggestions are provided how to proceed to the next level.

As part of a European Commission (EC) project this tool was administered in an Italian company which is reported in the following section.

Figure 2. Current H&S system.
5. Case study of a small Italian construction company

This is a company that started 60 years ago which is a family lead small construction company. There are 15 employees working and specialise in commercial, residential, school and refurbishment projects. The project cost varies from 30,000 to 2 million Euros. They undertake three types of work i.e. Skeleton 15% (foundation, column, beams and brickwork); skeleton with plaster and screed (75%) and complete building (10%).

Health and Safety legislation within the UK is established by statute law, the Health and Safety at Work Act 1974 although not a detailed act, it enables further legislation (regulations) to be passed without going back through parliament and under guidance from the European Union guidance in the form of directives. There are similarities of UK and Italian regulations. For example: PPE is called DPI. The Health and Safety Executive (HSE) implemented the Construction Design and Management Regulations (CDM 2015) with the intention to encourage the integration of health and safety into project management. A principal designer/principal contractor is appointed by the client to control the pre-construction/construction phase on projects with more than one contractor. The main duty is to plan, manage, monitor and coordinate health and safety during this phase which they are involved in.

Similarly Italians have Coordinative per IA Sicurezza. D. Lgs nr. 81/08, “a model of organisation and management” satisfies the requirement on health and safety, if it is constructed in accordance with OHSAS 18001 or with the UNI-INAIL guidelines. The regulations include:

Figure 3. H&S system.
construction activities in Italy are defined by state law. A company after a firm enrolled in an institution dedicated to work should follow the provisions of the Law D. lga. nr. 81/2008. This law identifies the liable subject around the activity of work and then gives each of the roles. It also lists the minimum requirements necessary to be able to exercise (technical and professional qualification). Therefore in this study it was explored how leadership in small company implements the regulations. As a starting point, the Chief Executive Officer (CEO) and the project manager filled the leadership and workers involvement questions of the toolkit. The mean scores were calculated for the options selected which resulted in 4C’s and 2D’s (Figure 3). This indicated that the company was in “walking mode” and in some instances in the “running mode”.

<table>
<thead>
<tr>
<th>Building Block</th>
<th>Risking x Running</th>
<th>Running x Spriting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Commitment</td>
<td>You should now be focused on gaining the commitment of your workers to H&amp;S. Get your workers to think how their behaviour not only affects them, but also their workmates/colleagues and their family. If they were to fall ill or become injured as a result of working unsafely, to encourage workforce commitment consistent with H&amp;S and the agenda in all meetings, give it due thought and attention.</td>
<td>Consistently demonstrate an “open door” approach to your H&amp;S support line put forward by your workers and involve them in implementing their own solutions (where feasible).</td>
</tr>
<tr>
<td>Worker Engagement</td>
<td>Regularly include your workers in your decisions on which solutions you choose for improving H&amp;S. Ensure workers are trained to participate in decision making. Discuss the pros and cons of different options with them. Encourage them to come to you with their ideas. You should now be jointly making H&amp;S decisions with your workers.</td>
<td>Give your workers appropriate responsibility for making decisions on H&amp;S matters that are directly relevant to them (e.g., PPE selection; tool choices; when they have breaks, hygiene etc.). Give your workers every opportunity to generate ideas on improving H&amp;S on an ongoing basis.</td>
</tr>
<tr>
<td>Prioritisation of Health and Safety</td>
<td>Ensure your workers are familiar with procedures. Through appropriate communication and your own actions ensure that they feel able to stop work in situations they perceive to be unsafe. Make sure you include in your communications that health matters are as important as safety matters. H&amp;S together should be regarded as important as productivity. Develop a strong business case (i.e. cost benefits of H&amp;S) to persuade leaders that H&amp;S is a top priority.</td>
<td>As far as possible, make sure that H&amp;S have a visible presence in all your dealings with your workers (e.g. as the first agenda item on any meeting, in all your documentation, and all your decision making). Continues to ensure that H&amp;S is a top priority for all leaders by prioritising your business cases, (i.e. cost benefits of H&amp;S taking priority over production). H&amp;S should now be a core company value.</td>
</tr>
<tr>
<td>Compliance</td>
<td>In consultation with workers, and considering previous risk assessments, start to think about what might go wrong in the future. Put preventative measures in place (e.g. signage/posters, training, etc.) following task specific risk assessments carried out with workers.</td>
<td>Use the worker engagement and your learning from experience on H&amp;S to identify new ways of improving the company’s overall H&amp;S. Generic and task specific risk assessments should be used on a regular basis to inform your H&amp;S decision-making.</td>
</tr>
<tr>
<td>Measurement</td>
<td>Broaden what you measure to include proactive indicators of both H&amp;S (e.g. amount of training provided, amount of discussions you have with your staff on H&amp;S). What do these additional measures tell you about your overall productivity in relation to H&amp;S? Consult your workers to help you decide what action to take. Together with your workforce, continue to monitor the link between what you are collectively measuring, your company’s productivity and everyone’s attitudes and approach to work, (e.g. morale, job satisfaction). Continue to take appropriate action based on your findings. Set yourself and your leaders objectives to improve H&amp;S on site.</td>
<td>Look at what other companies of your size and type of work are doing to improve their H&amp;S. Identify what you can learn from them and what they can learn from you.</td>
</tr>
<tr>
<td>Organisational Learning</td>
<td>Formal learning mechanisms should be in place (e.g. training, communication systems). Formal measures should be in place that uses worker engagement to identify and understand why ill health/accidents/ incidents and near misses happen. Modify your safety management system accordingly. Leaders openly admit to workers that their decisions play a part in H&amp;S outcomes.</td>
<td></td>
</tr>
</tbody>
</table>
Figure 4 shows the way forward for the company for leadership initiatives in: Commitment; Worker Engagement; Prioritisation of health and safety; Compliance; Measurement and Organisational learning. The next stage, the leadership of the company should aim is to reach the ‘sprinting’ stage as a long-term strategy.

For short term (within 6 months) the company should reach the ‘running’ stage. To enable achieve this ERM framework was proposed as part of the EC project.

6. Incorporating the enterprise risk management framework to health and safety

Analysis of the documents and focus group discussions with project team revealed that there should be a health and safety strand in the enterprise risk management framework and hence it was developed (Figure 5). This aspect was further taken forward and details of strategy, process and performance are looked into greater depth. This chapter discusses only the health and safety strand.

Strategy—organisational visions and objectives: as part of the strategy in any organisations H&S is paramount and must be considered. The starting point is to have a vision and objectives from the leadership team. Discussions reveal that there was no H&S policy document as part

Figure 5. Enterprise risk management with health and Safety.
of the company strategy but they were following aspects on H&S within the company and in its projects. Henceforth a health and safety policy was developed and provided to the company. The policy had general and specific aspects. The nine general aspects included:

1. to provide adequate control of the health and safety risks arising from our work activities
2. to consult with our employees on matters affecting their health and safety
3. to provide and maintain safe plant and equipment
4. to ensure safe handling and use of substances
5. to provide information, instruction and supervision for employees
6. to ensure all employees are competent to do their tasks, and to give them adequate training
7. to prevent accidents and cases of work-related ill health
8. to maintain safe and healthy working conditions
9. to review and revise this policy as necessary at regular intervals

Specific aspects must relate to who takes the responsibilities (a named person within the organisation); Arrangements for Health and Safety Risks Arising from Work Activities; Consultation with Employees; Safe Plant and Equipment; Safe Handling and Use of Substances; Information, Instruction and Training; Competency for Tasks and Training; Accidents, First Aid and Work Related Ill-Health; Emergency Procedures, Fire and Evacuation; Monitoring (ensure safe working practices are followed). This partially agrees with Warren [6] who states 8 ways in which safety in the construction sector can be improved:

1. Ensure equipment has been correctly assembled and installed
2. Make sure that all equipment is properly maintained and regularly checked
3. Avoid working at height where possible and find ways of decreasing it
4. Keep all walkways, stairs, and work areas clear of debris and obstructions
5. Make sure that all materials are stored away safely
6. Provide staff with protective equipment and make sure they can use it correctly
7. Ensure all employees are appropriately trained
8. Ensure all workplace tasks are risk assessed

The H&S policy provided to the small company is comprehensive as it takes into account Safe Handling and Use of Substances; Information, Accident reporting, First Aid and Work Related Ill-Health; Emergency Procedures, Fire and Evacuation; Monitoring. The next step within the ERM is to look into the process of health and safety which in discussed in the following sections.
7. Process within the ERM system: identification of health and safety risk factors

In Italy it is based on the type of client. If it is a public sector client then Health and Safety is considered separately and the cost of the project for construction is separate. Therefore there is no negotiation on the H&S aspects whereas the cost on the construction activities could be negotiated. For example if the total cost of the project is one million Euros the cost allocated for H&S is 50,000 Euros and 950,000 Euro for the construction phase. 50,000 Euro is fixed and must be used for H&S aspects whereas there is room for negotiations in 950,000 Euro say 10–20%. In the case of private client it is a lump sum contract and the cost of health and safety is included in the total cost of project at the tender stage.

When the contract is awarded and the site is to set up there is a checklist that could be used in the construction phase to make sure aspects of health and safety are considered. This can be a document which is based on knowledge gained from previous projects. In the case study company each project has a risk assessment H&S file which identifies project specific risks and also suggests methods to mitigate risk. The issue lies whether the labours on site are able to read and write to understand the risk assessment document.

The project level has to be linked to the company level. Therefore, based on the literature review and focus group with three members (CEO, Senior project manager, project manager) in the case study company 38 risk factors were identified (Table 2).

This list was given to the senior project manager who had experience as developer, planner, contractor and working for a company populated the matrix. Prior to that, they have to understand the risk scale. In a scale of five the risk factors are to be identified where 1—being the least risk and 5—being catastrophic (see Table 3). The probability factor is not considered as it depends on the projects they are involved. Also the relationship of the risk factors for project and the company was asked. Table 4 is a snapshot of 13 factors of the 38 risk factors. Y means it is a risk factor. Prior to discussing the risk factors it is important to look into the role of effective leaders in this context.

Edgeman et al. [30] noted that leaders are the raw material of business excellence as well as organisational failure. Some of the causes of failure are: lack of long-term management commitment; wrong people on the team; teams do not understand their work completely; team take too much; focus on metrics rather than processes; not positioning projects within a larger strategy; misunderstanding the organisation’s mission, goals and objectives. Welch and Welch [31] and McEwan [32] listed seven rules for effective leaders (see Table 5).

Leaders can be effective in helping those involved to think creatively and discover the possibility of achieving a win-win situation only when they incorporate the interests, pronounced or latent, from the different participating groups [33]. Thus, vision formation should result from mutual influences in the collaboration. In studying leader effectiveness, Denison et al. [34] found that the most effective leaders have styles that reflect greater complexity in their thinking and variety in their behaviours. They are able to recognise paradox, contradiction,
Scale Classification Explanation

1. Insignificant Insignificant infringement of operating procedure with immediate correction, none loss
2. Minor Low loss, <10% cost increase, <5% time increase, only very demanding applications are affected
3. Moderate Substantial loss, 10–20% cost increase, 5–10% time increase, quality reduction requires sponsor approval
4. Major Major loss, 20–40% cost increase, 10–25% time increase, quality reduction unacceptable to sponsor
5. Catastrophic Enormous loss, permanent damage, >40% cost increase, >25% time increase, project end item is effectively useless

Table 3. Risk scale.
and complexity in their environment, and simultaneously attend to seemingly opposing and competing requirements, such as the need for integration and differentiation, and the demand for accountability and creativity at the same time. Alternatively, Pitcher and Smith [35] examined the possibility of sharing strategic decision-making processes in teams of leaders with different leadership strengths. They concluded that top management teams that exhibit strong cognitive diversity—a balanced combination of different types of leaders—are more successful in producing long-term results, because they include diverse ideas stemming from different

Table 4. Seven rules for effective leaders.

| Health & Safety Risk Factors | There are 20 key risk factors identified for Health and safety aspects for construction sites. Please put “y” in the appropriate space for the following factors: 1. Minimum Risk Factor (MRF) means minimum risk factor. The risk factors for project and company could be marked as “y”. Please see examples provided in the bottom of the sheet. Also, the influence of MRF (high risk indicator) is shown at the bottom of the table.

cognitive perspectives and permit a more comprehensive and creative analysis of strategic alternatives. Therefore it is necessary to have H&S measurement performance matrix.

8. Performance—health and safety measurement performance

Thiveos [36] noted that leaders with responsibilities for health and safety concerns in their organisations rely on technology solutions to manage training, certification, incidents, observations, records, documents, risk assessment, corrective actions, inspection, monitoring, auditing, and to provide results-oriented performance metrics to stakeholders. Furthermore, Kelloway et al. [37] identified the 10 different health and safety leadership actions including: expressing satisfaction when jobs are performed safely; rewarding achievement of safety targets; continuous encouragement for safe working; maintaining a safe working environment; suggesting new ways of working more safely; encouraging employees to openly discuss safety at work; talking about personal value and beliefs in the importance of safety; behaving in a way that demonstrates commitment to safety; spending time to demonstrate how to work safely; and, listening to safety concerns.

In the EC project a Balance Score Card (BSC) concept developed by Kaplan suggests that we view the organisation from four perspectives, and to develop metrics, collect data and analyse it relative to each of these perspectives were adapted. Therefore the identified health and safety risk factors were mapped with the four perspectives i.e. financial, clients, business process and learning and growth. These are further classified as: Financial (cash flow, profit, stock turnover, turnover claim); clients (client satisfaction, new client, client loyalty); business process (quality of services, number of errors; percentage of delivered project; average hourly cost of labour); learning and growth (resources spent in training; workers satisfaction; number of prestigious project; resources spent in research).

From the analysis of Table 6 it clearly indicates that health and safety risks factors fall into learning and growth of the company within which works satisfaction is ranked as high and medium risk (8 major + 6 medium + 1 minor = 15 risk factors) followed by business process related to quality of services (5 major + 3 medium = 8) and clients related to client satisfaction (4 major + 3 medium + 1 minor = 8). Thereafter is the financial aspect (4 major + 1 medium + 1 minor = 6) related to profit followed by business process related to number of errors (2 major + 3 medium + 1 minor = 6).

It is interesting to note that financial aspects comes third whereas the learning and growth comes first therefore it does not surprise why small and medium enterprises pay less attention to health and safety aspects. Especially activities on a project or in a company are going well i.e. no accidents or fatality and/or no inspections on site. However, it is revealing that violation of health and safety law and regulations have an impact on all the four aspects of BSC (financial, clients, business process and learning and growth). This is an important finding from this case study which informs professional at site (operatives/site trainees), project and programme level (site/project/programme managers) and for leadership team (directors/board members) regarding the attention that H&S needs to be given.
9. Conclusion

The construction sector is characterised for having the largest numbers of accidents and health deterioration among all the working sectors. Companies must also have a health and safety system which has the strategy, process and performance aspects. Irrespective of the size of the company there should be a health and safety policy. This leads to providing health and safety manual at the construction site which has the risk assessments. The companies should make sure the employees on the site are able to read and understand the associated risks which will enable them to implement it. In addition, it is important for construction stakeholders to invest in health and safety strategies.

The first step is to assess at what level the company is i.e. starting, get going, walking, running and sprinting from six building blocks. They are: commitment, workers engagement, prioritisation of H&S, compliance, measurement and organisational learning. Thereafter apply the ERM which includes strategy, process and performance to enable to achieve sustainable company success. In the case study company eight risk factors stood out of the 38 identified which had influence on financial, client, business process and learning and growth. All the eight risk factors contributed to workers/professional satisfaction. They are H&S aspects during tight project schedule; Lack of DPE/PPE; measures to prevent fall from heights; measures during excavation; using defective scaffolding; providing fire prevention measures; individual stress and violation of regulations.

Table 6. Balance score card with high, medium and minor risk factors.

![Table 6. Balance score card with high, medium and minor risk factors.](image-url)
In small companies leadership must have health and safety policy which clearly publicise and states the values behind health and safety standards and procedures through simple ways such as posters and the repetition of goals such as everyone going home safely at night. Therefore, in conclusion leadership for H&S risk management is paramount for a survival and sustainability of small companies.
